# Introduction

This report, produced by Reputation Lab on behalf of the Royal Institute for Strategic Studies (IRES), is constitutes the tenth edition of the annual analysis of the reputation of the Kingdom of Morocco among international public opinion, launched in 2015. The study covers perceptions of Morocco in 27 countries, including major global powers and other important nations across five continents, selected for their economic, political, or cultural influence. The data analyzed in this report comes from a large-scale study, with fieldwork conducted in March and April 2024 (RepCore® Nations 2024).

Reputation is the combination of feelings about a person, company, or organization based on perceptions, opinions, value judgments, and evaluations made by stakeholders. It is an emotional concept encapsulating feelings such as admiration, respect, and trust. Despite its emotional nature, it can be explained using various rational variables, particularly in the context of a country, where it is linked to economic, political, social, and cultural factors. A good or bad reputation will influence attitudes and behaviors towards a person, company, or organization.

As with individuals and businesses, countries also benefit from a reputation grounded in admiration, respect, and trust among international observers.

A country's reputation is shaped by several factors, including direct experiences, such as travel, interactions with locals, and the consumption of local products, along with the country's communication strategies, including campaigns promoting tourism, products, and brands, as well as external perceptions such as media coverage, and the opinions of family, friends, and others. In the absence of information, stereotypes and prejudices formed over the years by the collective imagination can also influence perceptions.

Empirical evidence demonstrates that reputation has a tangible impact on economic indicators, such as tourist arrivals, exports, and foreign direct investment, underscoring its importance for a nation's economic well-being. Furthermore, a country that has a strong reputation can wield greater influence within the international community than what might be expected solely from its economic or military capabilities—this is commonly referred to as 'soft power'.

As in previous years, the results of the study regarding Morocco's global reputation are influenced by the geopolitical situation. In addition to the war in Ukraine, conflicts in the Middle East and the war in Gaza, have significantly shaped international public opinion. This has occurred in a context of diverse sentiments and polarization regarding the positions adopted by the governments of each country and the debate generated within nations, reflecting their different political choices.

Furthermore, it is important to note that the context of the analysis of Morocco's global reputation, conducted since 2015 in successive editions, comprises the G7 countries and Russia (formerly G8), encompassing the major Western powers and Russia. In the context of the ongoing conflict in Ukraine, it is notable that the reputation of Morocco has remained relatively stable; this stands in contrast to other countries included in this study, which have adopted a more active stance on the matter.

However, the military operation conducted by Israel in Gaza had a notable impact on the reputation of the 72 countries included in this study. The study reveals that international public opinion is strongly opposed to Israel's intervention, with its reputation indicator declining significantly in 2024. Similarly, nations whose public opinion, media, or political powers have opposed Israel's armed action have seen their reputations decline in that country. Morocco, which has consistently supported the Palestinian cause, serves as a notable example. Similarly, South Africa, which has previously denounced Israel before the International Criminal Court in The Hague for alleged crimes of genocide.

The results of the 2024 edition of the study on the reputation of Morocco in the world reflect a continuation of the trend observed in 2022 and further consolidated in 2023, of the paradigm shift in global public opinion expectations when countries are evaluated. Variables related to environmental, social, and governance (ESG) criteria and the 2030 Agenda, particularly environmental protection, climate change mitigation, and human rights, have become major levers in building a country's reputation, replacing other variables that previously held more weight.

In this complex and changing context, the Kingdom of Morocco faces several issues and challenges in building its national brand and consolidating its international reputation, which are further explored in the subsequent sections of this report.

# 1 Methodology

## 1.1 RepCore® Nations

RepCore® Nations is the international study developed by Reputation Lab to assess the reputation of countries among the general population of the country concerned, as well as among those of third countries. The methodology employed is an adaptation of the RepCore® reputation measurement model, usually applied to the diagnosis of corporate reputation.

The RepCore® model explains a company's reputation - defined as the admiration, respect and trust it inspires among its stakeholders - by means of twelve rational variables grouped into three dimensions (Product and Service Offering, Organization and Sustainability). In addition, this model analyzes the extent to which reputation can have an impact on supportive attitudes such as the intention to buy, invest in, recommend or work for the company.

The RepCore® Nations methodology uses the same general RepScore reputation indicator as the corporate model, but adapts the rational variables and supportive attitudes to the context of a country's reputation. The RepCore® Nations variables cover, among other things, the economic, political, social and cultural environment of a nation, as well as its ability to attract tourists, investors or potential buyers of its products and services.

A country's reputation encompasses all existing feelings towards it, formed from perceptions and opinions about different elements of its reality of its various attributes. The "RepScore" indicator measures the emotional attractiveness that people feel towards a nation the emotional appeal that individuals associate with a nation. It is a mathematical construct based on the following elements: admiration, respect, trust and good feeling; values obtained directly through research.

In Reputation Lab's RepCore® Nations methodology, the RepScore, or reputation indicator, is the dependent variable that is explained on the basis of various attributes grouped into dimensions. The mathematical model calculates the influence of each attribute and dimension on a country's reputation, as well as the values obtained from these attributes for each nation analyzed.

A total of 22 attributes are used to analyze country reputation is utilized to evaluate a country's reputation. Based on a factorial analysis, they have been grouped into five dimensions: Ethics and transparency, Institutional quality, Quality of life, Level of development and Human factors.

All the rational levers of the RepCore® Nations model are detailed in the following table:

**Figure 1:** Rational levers of RepCore® Nations: dimensions and attributes

Dimension	Attribute
Ethics and responsibility	Ethical and transparent
	Respect for human rights
	Protection of the environment
	Fights against climate change
	Efficient management of public resources
Institutional quality	Effective government and institutions
	Respected leaders
	Social welfare
	Friendly business environment
	Commitment to the international community
Quality of life	Attractive lifestyle
	Appealing natural environment
	Leisure and cultural activities
	Safety
Level of development	Well-known brands and companies
	Cultural legacy
	Technologically advanced
	Quality of products and services
	Success in sports
Human factor	Educated and reliable people
	Friendly people
	Quality of the education system

Figure 2: RepCore® Nations' elements

The RepCore® Nations methodology also analyzes respondents' intention to recommend visiting the country, investing in it, buying its products or services, or living, studying and working there. Combining these variables with the preceding attributes enables us to study their influence on people's behavior in the country analyzed.

Figure 3: The relationship between a country's reputation and value creation. Pearson correlations between the RepScore indicator and supportive attitudes

## 1.2 Scope of the RepCore® Nations 2024 study

The fieldwork for this study was conducted in 27 countries by interviewing a sample of the general public with a sample of the general public about their perceptions of Morocco and other nations.

While the analysis of Morocco's reputation was conducted in comparison to with four benchmark countries selected by IRES (Turkey, South Africa, Mexico, and Chile), the study also includes an analysis of the reputation of a much wider group of nations.

For the purposes of the international ranking, a homogeneous group of 60 countries was selected (using GDP as the selection criterion) and their reputations were analyzed by interviewing residents of the most industrialized nations. An additional group of 12 countries were Additionally, a further group of 12 countries was included in the analysis but not in the international ranking, for a total of bringing the total to 72 countries.

To ensure consistency with previous editions, this report continues to use leverage public opinion in eight countries as the general context for analysis: all G7 countries (Canada, France, Germany, Italy, Japan, the UK, and the USA) and Russia.

In light of the prevailing circumstances, Reputation Lab has opted to utilize solely the interviews conducted within the G7 countries as the foundation for its public rankings. Additionally, the results obtained in Russia and China, where the same 72 countries were also analyzed, have been examined separately.

In addition to the fieldwork conducted in the nine countries included in the general RepCore® Nations study (G7+Russia+China), IRES has decided to analyze the reputation of Morocco and the benchmark countries in the following 18 additional countries: Algeria, Australia, Brazil, Belgium, Chile, Egypt, India, Israel, Kenya, Mexico, Morocco, Netherlands, Nigeria, South Africa, South Korea, Spain, Sweden, and Turkey.

The sample size for Morocco is 400 evaluations per country for each country included in the analysis, with the exception of except for Morocco, where the number of ratings is 700, and China and India, where the number of ratings is it is expanded to 1,000.

## Technical data

- ▶ **Target (stakeholder):**  
General public in the countries participating in the study: people with sufficient (declared) knowledge of the country whose reputation is being assessed.
- ▶ **Methodology:**  
CAWI (interviews via the Internet).
- ▶ **Date of fieldwork:**  
March-April 2024.
- ▶ **Total sample:**  
37,143 interviews carried out.
  - ▶ These interviews provided a minimum of 100 ratings for each country in each of the "evaluator" countries.
  - ▶ In the case of Morocco, the number of ratings amounts to 1,000 in China and India, 700 in Morocco and 400 in each of the 24 other countries where the Kingdom's reputation has been assessed.
- ▶ Scores were adjusted and standardized globally, considering cultural differences between countries, based on historical data.
- ▶ The overall scores used in the IRES general report are the result of averaging the scores obtained in all G7 countries plus Russia.
- ▶ The overall scores used in Reputation Lab's global rankings are the result of averaging the scores obtained in the G7 countries.
- ▶ **Benchmark countries:**  
Morocco's external and internal reputation was compared with those of four benchmark countries: South Africa, Chile, Mexico and Turkey.

### 1.3 Driver analysis

The RepCore® Nations model allows us to comprehend how a country's reputation is shaped by a set of rational variables. However, not all the variables analyzed have the same impact on reputation, which is defined as the degree of admiration, respect, and trust that a country inspires. The driver analysis enables us to identify which elements are most relevant according to the public opinion expectations.

While it is crucial to assess the country across each rational variable to identify its strengths and weaknesses in terms of international image, it is also essential to determine which of these variables have the greatest impact on its reputation to prioritize them for management.

The weight of an attribute is neither set arbitrarily nor derived from external sources. Instead, it is determined based on the study data. As the weight of an attribute increases, so does its impact on a country's reputation, which is measured in terms of admiration, respect, and trust.

The driver analysis has been calculated in relation to the individual attributes, ensuring that the weight of each dimension is equivalent to the sum of the weights of its component attributes.

The result of the international driver analysis revealed the following weights for the rational variables among public opinion in the countries where the fieldwork was conducted:

Figure 4: Importance of rational levers for building a country's reputation in the G7 countries and Russia as a whole

The  $R^2$  value of the adjusted model is 0.678, which represents a good fit and supports the conclusion that the selected attributes explain the countries' reputations.

It is also important to note that the distribution of weights among the attributes is quite homogeneous: there are no attributes without weight nor any attribute with a weight significantly higher than the others. A country's reputation is therefore based on variables and achieving a high rating in some areas is not sufficient to forge an excellent reputation if the perception is low in other areas.

The 2024 edition of the study confirms that “Ethics and responsibility” is the most important dimension for building a country's reputation. Indeed, “Protection of the environment” is identified as the most important attribute, followed by “Respect for human rights”, “Efficient management of public resources” and “Fights against climate change”. These four attributes are part of the “Ethics and responsibility” dimension.

The data clearly demonstrate a strong awareness of the climate emergency among the public opinion, and the need to pursue efforts within the framework of the 2030 Agenda at the global level. It is evident that ESG criteria, so important in building corporate reputations, continue to play a pivotal role in strengthening the reputation of nations.

## 2 The reputation of Morocco across the G7 countries + Russia

### 2.1 Overview

A review of the reputation indicators of the 60 countries with the highest gross domestic product reveals a general stability. While there was a slight decline last year, this has been offset by a 0.5-point increase in the average reputation index of the major economies evaluated by the general public of the G7 countries and Russia.

The countries whose reputations have shown the most positive evolution over the past year are Ethiopia, Thailand, Peru, and Qatar. In contrast, the countries whose reputations have experienced the greatest decline are Israel and Ukraine: the former after its disproportionate military intervention in Gaza, which was perceived very negatively on the international scene; the latter, which benefited from the empathy of external observers following the Russian invasion, seems to have lost some of it after two years of war.

Morocco recorded an improvement of +0.8 points on its reputation indicator, reaching 48.7 points, a moderate level on the "RepCore" normative scale and slightly below the average of the 60 countries with the highest GDP (49.3 points). Currently ranked 30th, after moving up 4 positions from 2023, Morocco has established itself as the African and Arab country with the best reputation.

This improvement in Morocco's reputation is more significant in the specific countries where it was analyzed (on average an increase of one point). It is much more significant in Morocco (internal reputation) with an increase of 3.7 points, reaching its historical maximum (64.8 points) and approaching the "excellent" level.

Switzerland, Norway, Sweden and New Zealand are the top-ranked countries, though none of them reaches the "excellent" reputation level, while Russia, Iraq and Iran are the countries with the worst reputation indicators (RepScore) for the third year running, all three rankings are "poor" on the RepCore® normative scale.

**Figure 5: RepScore ranking of the 60 countries with the highest GDP in the G7 countries+Russia**  
 External Reputation

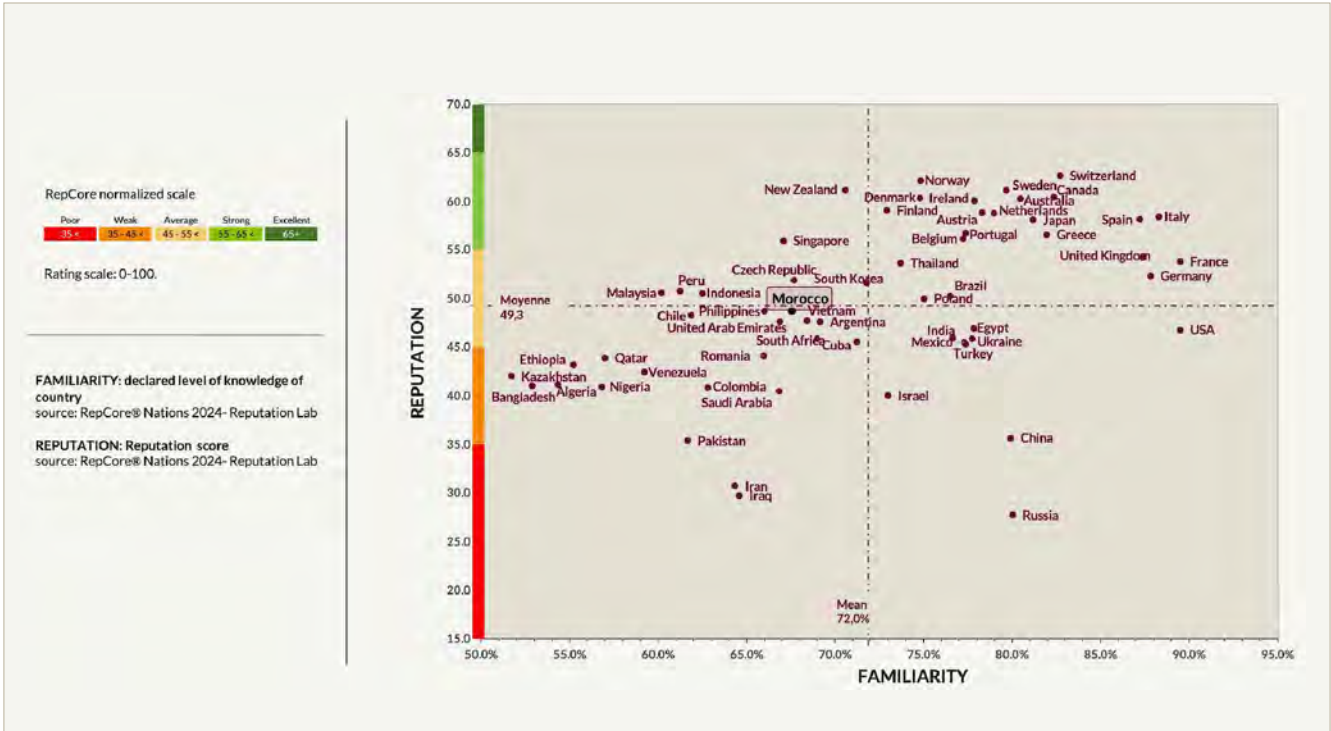

There was a 3.2% decline in familiarity with Morocco among the general public in all G7 countries and Russia in 2024, with the percentage of respondents declaring some knowledge of the country standing at 67.5%. This decline in familiarity may be attributed to a more discreet presence of Morocco in the international media. The success of the national soccer team at the 2022 World Cup led to a significant surge in online searches for Morocco, which, along with other information about the country, contributed to an increase in familiarity levels in 2023. However, this trend reversed in 2024.

As illustrated in the table above, there is almost no correlation between familiarity and reputation. While a high level of familiarity can reinforce the economic impact of a country's reputation, there are instances where countries with high familiarity may have poor reputations (such as Russia or China). Conversely, there are also countries with low familiarity but positive reputations (such as New Zealand or Singapore).

Morocco's benchmarks also showed a slightly positive trend in 2024: Chile (+0.8 points), Mexico (+0.7 points), South Africa (+0.4 points) and Turkey (+0.1 points). Despite this positive movement, Morocco managed to expand the gap in the ranking relative to its benchmarks.

Figure 6: Familiarity vs. Reputation of the 60 countries with the highest GDP in the G7 and Russia

Morocco's reputation is not uniform across the G7 countries and Russia. It performs best in Germany, France, and the UK, and least well in Japan and Italy. Compared to its reference countries, Morocco has the best reputation in France, the UK, the USA, and Russia, while Mexico is the best perceived in Italy, Turkey in Japan, and Chile in Canada and Germany.

Figure 7: Evolution between 2013 and 2024 in the reputation of Morocco and its benchmark countries across the G7 countries and Russia

Figure 8: The reputation of Morocco and the benchmark countries in the G7 and Russia

	Morocco		South Africa		Chile		Mexico		Turkey	
	2024	vs.'23	2024	vs.'23	2024	vs.'23	2024	vs.'23	2024	vs.'23
Germany	52.8	1.4	49.7	-4.2	55.0	-2.1	54.6	5.8	45.7	0.0
France	52.5	0.5	51.8	-1.6	52.0	-1.0	49.2	-2.9	46.7	-3.3
United Kingdom	51.1	1.7	44.8	-1.2	49.5	-1.5	49.1	0.0	50.7	2.1
USA	49.2	0.7	47.7	3.1	47.7	4.0	37.4	2.3	37.7	-1.5
Canada	47.2	1.2	43.1	5.2	48.4	5.9	41.7	1.7	43.5	3.1
Russia	47.0	0.3	46.0	6.9	43.9	-2.8	45.0	-0.3	46.2	-2.2
Japan	44.9	-0.5	39.7	-1.9	44.6	1.8	41.1	-0.5	49.7	-0.1
Italy	44.9	0.9	43.9	-3.3	45.2	1.7	45.9	-0.5	42.3	2.7

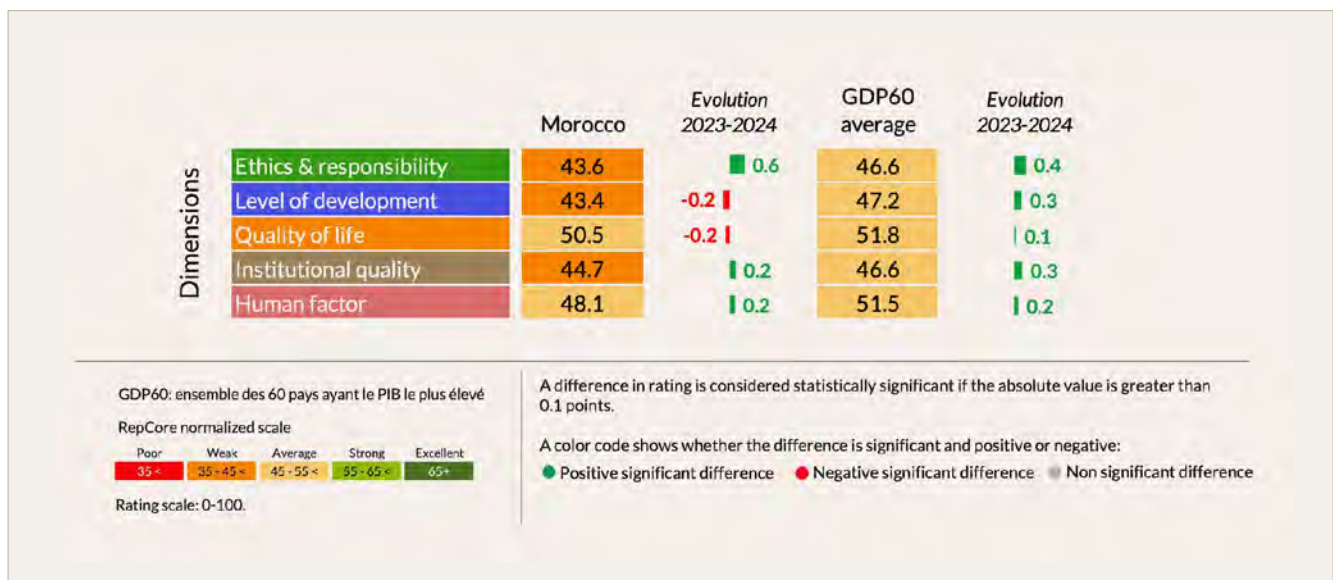

## 2.2 Strengths and weaknesses of Morocco as perceived across the G7 countries and Russia

In alignment with its reputation indicator, Morocco performs slightly below the average of the 60 countries with the highest GDP across all five rational dimensions. "Quality of life" is Morocco's greatest relative strength, with a difference of just 1.4 points from the average of the 60 largest economies. While "Level of development" remains a challenge for Morocco, falling 4.2 points just below the international average.

A review of the evolution of these dimensions reveals that stability predominates, with minimal fluctuations from the 2023 results. However, the "Ethics and responsibility" dimension stands out with a notable increase of 0.6 points

A comparison of Morocco's rational perception with that of the four reference countries in 2024 reveals a similar reputational profile across all five countries. Moderate scores are observed in the "Quality of life" and "Human factor" dimensions, while lower scores are recorded in the remaining dimensions. Chile is the only country in the group to achieve a moderate level in the "Ethics and Responsibility" dimension. However, its scores in all five dimensions are not significantly different from those of Morocco.

**Figure 9:** Evolution, between 2023 and 2024, of the perception of Morocco and all 60 countries with the highest GDP (GDP60) regarding to rational dimensions in all G7 countries and Russia

Morocco's comparative advantages relative to the benchmark countries, except Chile, lie in the most relevant dimensions involved in building a nation's reputation: "Institutional quality" and "Ethics and responsibility."

A detailed examination of the 22 rational attributes of the RepCore® Nations model reveals that Morocco is slightly below the average of the 60 countries with the highest GDP in each attribute. However, the generally positive trend observed in 2024 has led to a narrowing of the gap in certain areas.

Morocco continues to lag behind the study average in the following rational attributes: "Technologically advanced" (-6.5 points), "Quality of education system" (-5.7 points), "Educated and reliable people" (-4.5 points), and "Well-known brands and companies" (-4.3 points). Conversely, Morocco is closer to the 60-country average for "Respected leaders" (-0.9 points), "Leisure and cultural activities" (-0.9 points), and "Appealing natural environment" (-0.9 points).

Figure 10: Evaluation of Morocco and benchmark countries in rational dimensions in all G7 countries and Russia

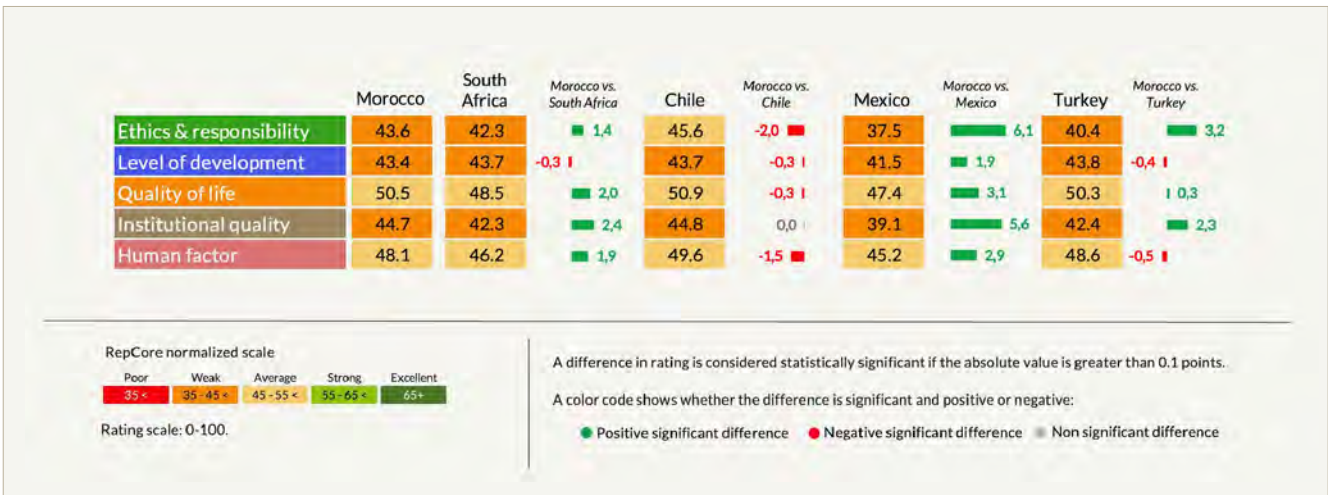

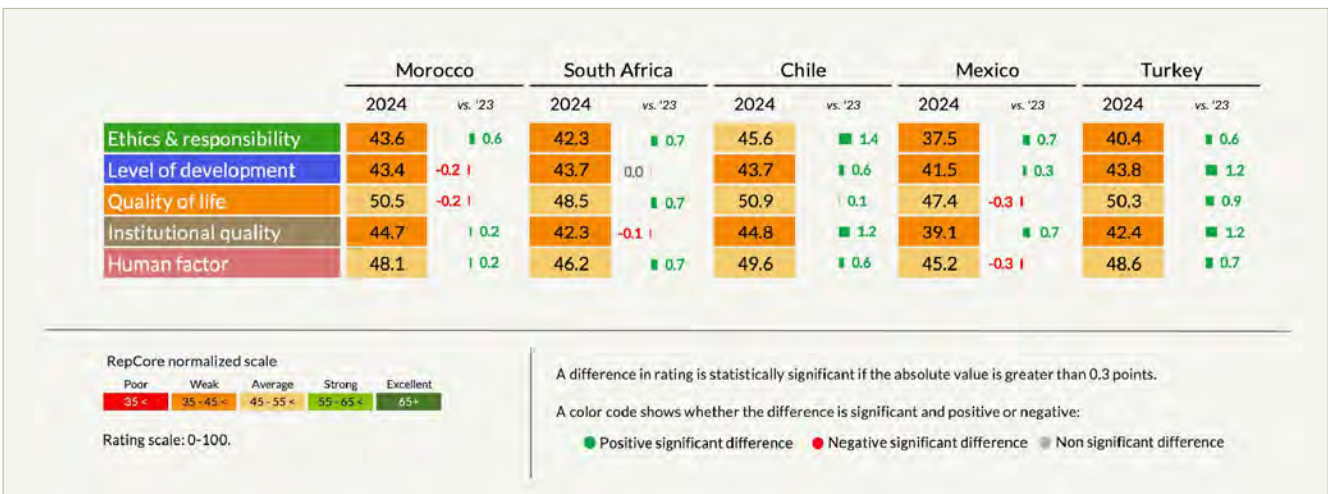

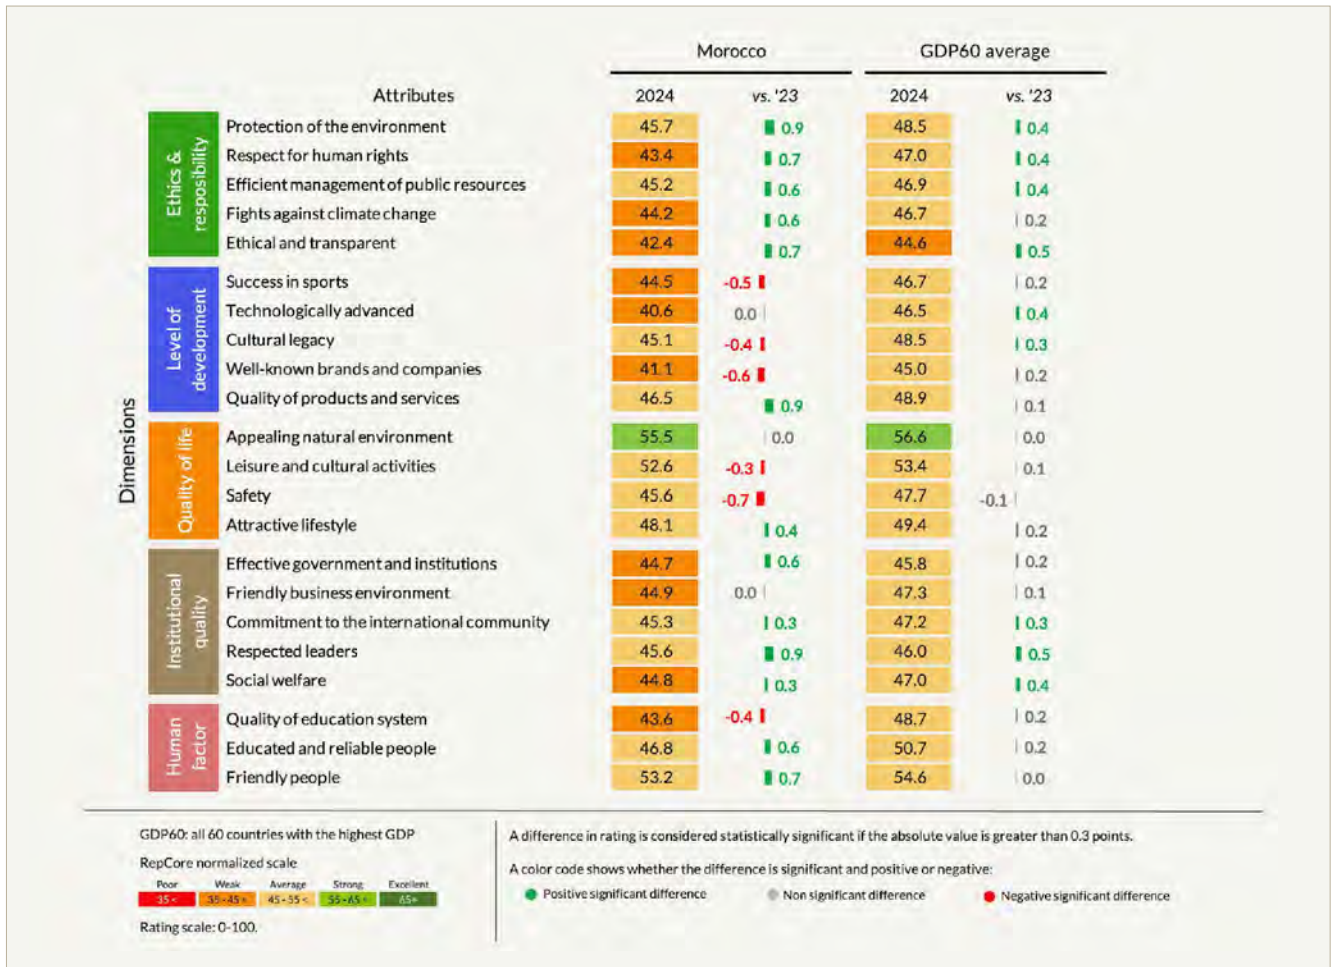

Figure 11: Evolution, between 2023 and 2024, of the perception of Morocco and benchmark countries regarding to rational dimensions in all G7 countries and Russia

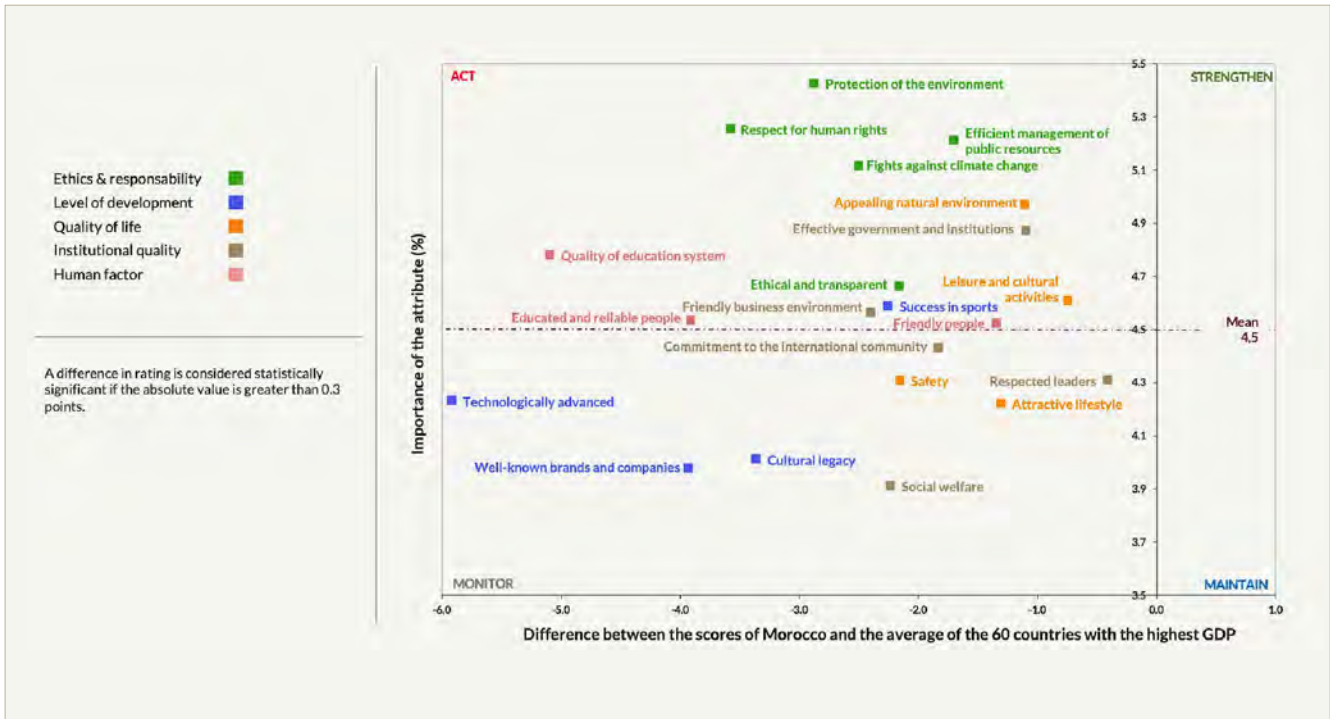

**Figure 12: Evolution between 2023 and 2024 in the perception of Morocco and the average of the 60 countries with the highest GDP regarding to rational attributes in all G7 countries and Russia**

Overall, Morocco's reputational profile remained stable between 2023 and 2024. However, some attributes experienced slight variations, with most showing an upward trend, while others showed declines. It is noteworthy that the ratings for attributes such as "Respected Leaders" (+0.9 points) increased. This is likely due to the leadership of His Majesty King Mohammed VI, the good governance demonstrated during the earthquake of September 2023, and His Far-Sighted Vision, as evidenced by the launch of the Royal Initiative for Atlantic Africa.

Additionally, the evaluation of "Quality of products and services" saw a noteworthy improvement (+0.9 points), as did the perception of "Protection of the environment" (+0.9 points), which may have been influenced by Morocco's efforts to reduce greenhouse gas emissions by investing in renewable energy sources. Also worth mentioning are slight downward movements in "Safety" (-0.7 points), "Well-known brands and companies" (-0.6 points) and "Success in sports" (-0.5 points).

**Figure 13: Risks and opportunities for Morocco compared with the 60 countries with the highest GDP in the G7 and Russia as a whole**

Morocco's relative advantages compared to the world average in the perception of attributes are listed below, in descending order:

- ▶ "Leisure and cultural activities"
- ▶ "Respected leaders"
- ▶ "Appealing natural environment"
- ▶ "Effective government and institutions"
- ▶ "Friendly people"
- ▶ "Attractive lifestyle"

Morocco's weaknesses, compared to the world average, relate to the following attributes:

- ▶ "Technologically advanced"
- ▶ "Quality of the education system"
- ▶ "Educated and reliable people"
- ▶ "Well-known brands and companies"
- ▶ "Cultural legacy"
- ▶ "Respect for human rights"

A comparison between Morocco's results and the benchmark countries reveals that the Kingdom excels in 18 of the 22 rational attributes, including several key variables in building the reputation of nations.

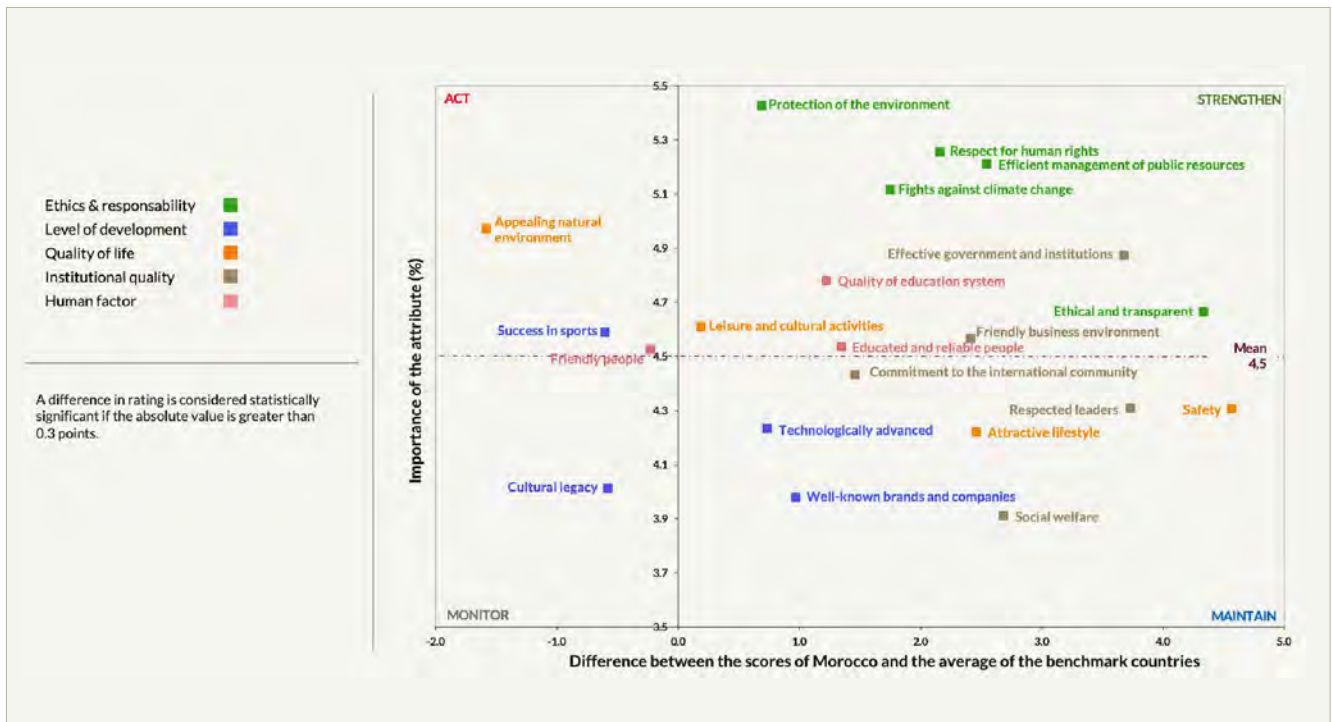

Morocco's key competitive advantages over the average of the reference countries are as follows:

- ▶ “Safety”
- ▶ “Ethical and transparent”
- ▶ “Respected leaders”
- ▶ “Effective government and institutions”
- ▶ “Social welfare”
- ▶ “Efficient management of public resources”

In the same context, Morocco's four main areas for improvement are as follows:

- ▶ “Appealing natural environment”
- ▶ “Success in sports”
- ▶ “Cultural legacy”
- ▶ “Friendly people”

Figure 14: Risks and opportunities for Morocco compared with benchmark countries in the G7 and Russia as a whole

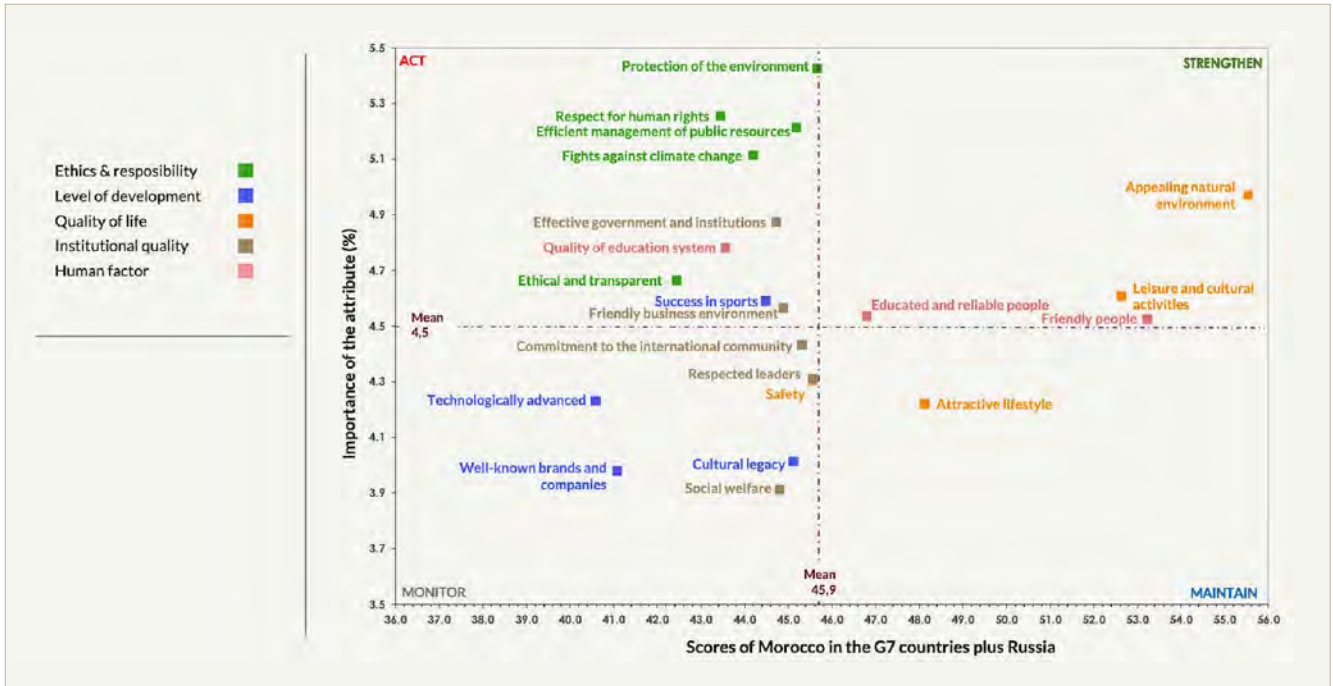

Interestingly, two of these weaknesses ("Appealing natural environment" and "Friendly people"), are in fact relative strengths when we compare Morocco with the global average.

Morocco's reputation profile has evolved between 2015 and 2024. The attributes "Appealing natural environment" and "Leisure and cultural activities" remain its main assets, making the Kingdom an attractive tourist destination. In recent years, perceptions of the "Ethics and responsibility" and "Institutional quality" variables have strengthened, setting Morocco apart from the average of its reference countries, although it has not yet reached the level of the largest economies.

Morocco outperforms the benchmark countries average in attributes such as "Ethical and transparent", "Respected leaders", "Efficient government and institutions" and "Safety", a profile that makes the Kingdom a reliable partner on the international stage.

Morocco continues to excel in absolute terms in three areas crucial for building a nation's reputation: "Appealing natural environment," "Friendly people," and "Leisure and cultural activities." Nevertheless, there is considerable room for improvement in certain attributes where Morocco has already acquired advantages over its benchmark countries, which could contribute to strengthening its brand image, such as "Ethical and transparent", "Respect for human rights" and "Protection of the environment".

Figure 15: Morocco's strengths and weaknesses among G7 countries and Russia

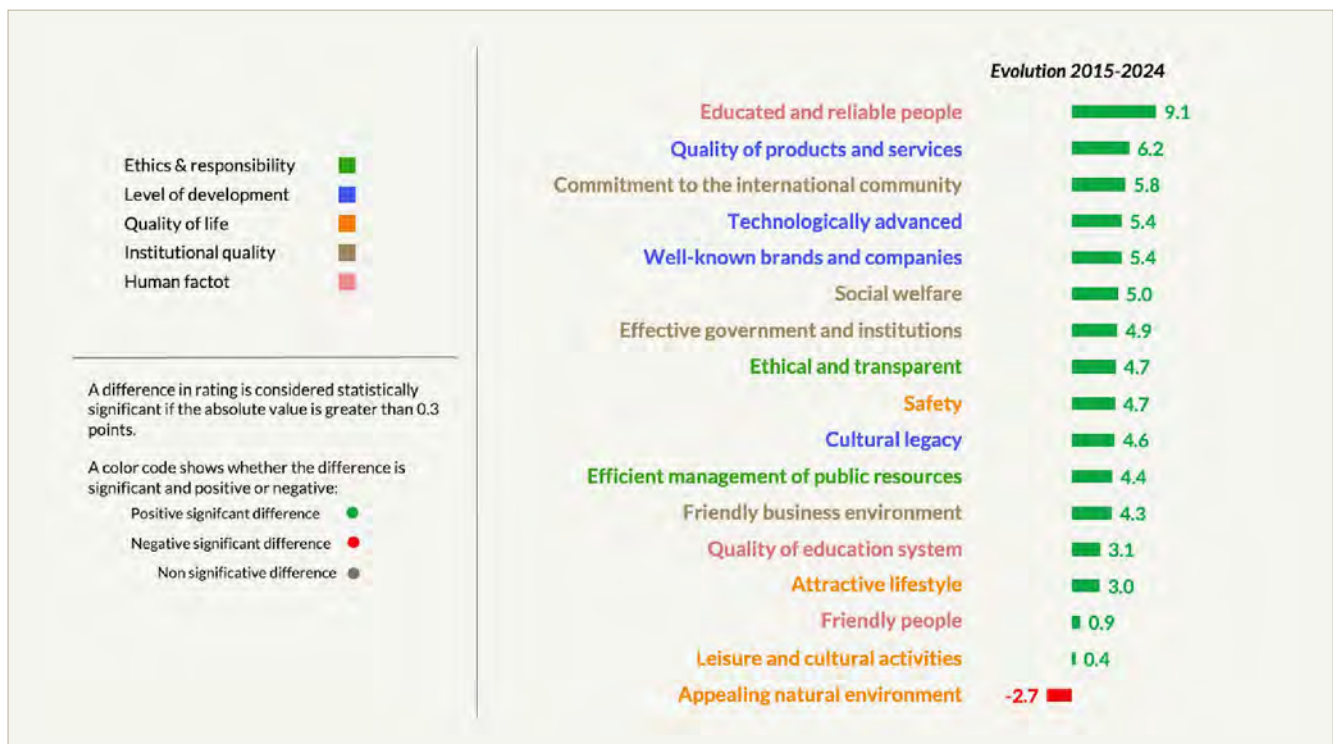

## 2.3 Evolution of the perception of Morocco in the rational attributes between the year 2015 and the year 2024

The remarkable evolution of the perceptions associated with Morocco can be seen by comparing its image profile in 2015, the first year in which the report on its global reputation was compiled, with data from 2024.

"Educated and reliable people" is the attribute with the most remarkable increase (+9.1 points), followed by "Quality of products and services" (+6.2 points) and "Commitment to the international community" (+5.8 points).

While Morocco is consistently highly rated by the inhabitants from the G7 countries and Russia in the attributes "Appealing natural environment", "Friendly people", and "Leisure and cultural activities", the country's image is increasingly shaped by other factors. It is notable that the "Appealing natural environment" is in fact the only attribute to exhibit a negative trend of -2.7 points between 2015 and 2024. In contrast, attributes within the "Level of Development," "Institutional Quality," and "Ethics and Responsibility" dimensions have shown significant progress during this period.

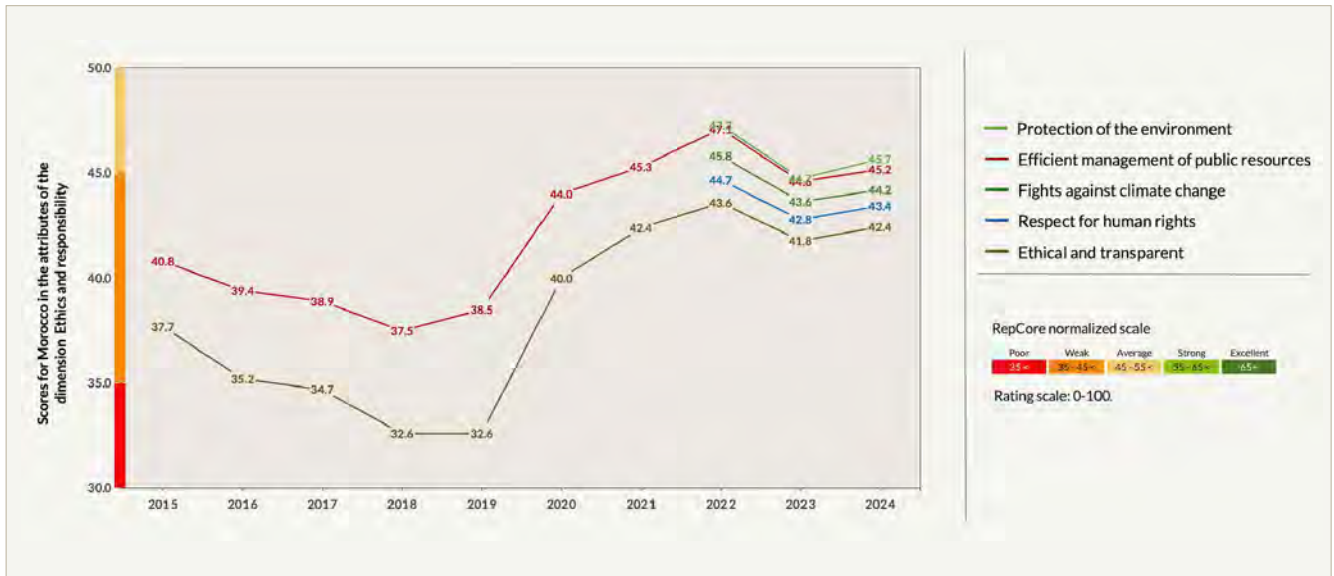

**Figure 16:** Evolution of the perception of Morocco in the rational attributes between 2015 and 2024 in all G7 countries and Russia

The greatest progress in the perception of the attributes of the dimensions "Level of development", "Institutional quality" and "Ethics and responsibility" takes place between 2019 and 2022.

**Figure 17:** Evolution between 2015 and 2024 of the perception of Morocco across the G7 countries and Russia in the attributes of the "Ethics and responsibility" dimension

**Figure 18:** Evolution between 2015 and 2024 of the perception of Morocco across the G7 countries and Russia in the attributes of the "Level of development" dimension

Figure 19: Evolution between 2015 and 2024 of the perception of Morocco across the G7 countries and Russia in the attributes of the "Institutional quality" dimension

Figure 20: Evolution between 2015 and 2024 of the perception of Morocco across the G7 countries and Russia in the attributes of the "Quality of life" dimension

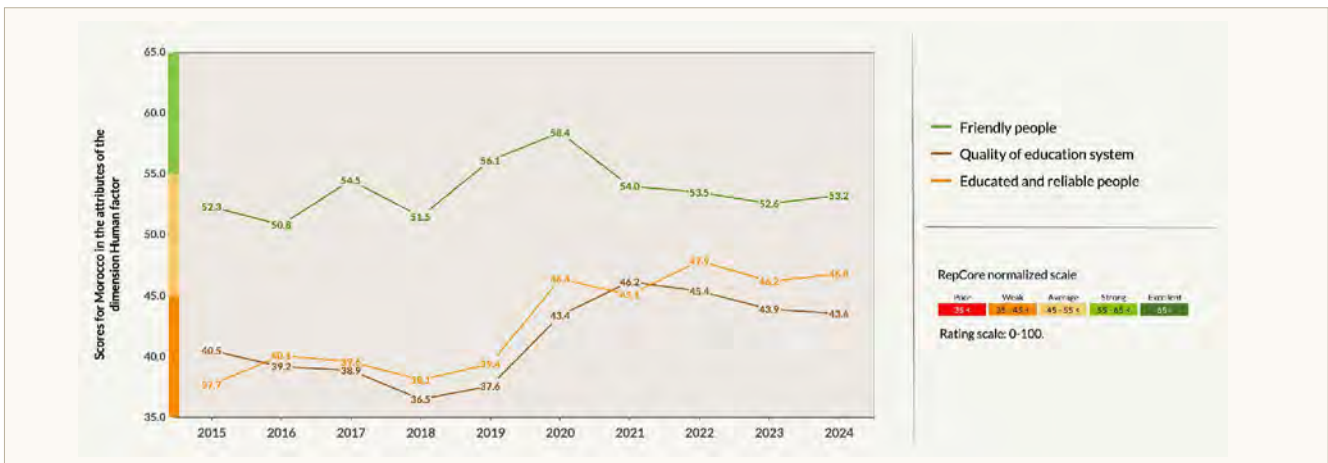

Figure 21: Evolution between 2015 and 2024 of the perception of Morocco across the G7 countries and Russia in the attributes of the "Human factor" dimension

## 2.4 Supportive attitudes towards Morocco in the G7 countries and Russia

The RepCore® Nations study also analyzes respondents' supportive attitudes towards each country, providing a deeper understanding of how a nation's reputation can create or destroy value. As indicated in the methodology section, there is a strong correlation between the reputation indicator and supportive attitudes, such as the intention to visit the country, invest in it, or buy its products.

The intention to visit the country is the supportive attitude where Morocco scores highest, in line with good perceptions of attributes such as "Appealing natural environment" or "Leisure and cultural activities". In fact, Morocco scores slightly higher on this variable than the average of the 60 countries with the highest GDP. Other supportive attitudes for which Morocco is close to the international average include recommend visiting the country and organizing or attending events there. However, the supportive attitude where

Morocco is furthest from the international average is to recommend studying in the country, which is not surprising given its low score on the "Quality of the education system" attribute.

In 2024, Morocco saw a slight improvement in the intention to attend or organize events in the country (+0.5 points) and a modest decline in the recommendations to visit the country (-0.7 points), live there (-0.4 points) or work there (-0.3 points).

In line with its stronger reputation, Morocco also outperforms the reference countries in nearly all support attitudes. Chile, however, scores slightly higher in the intention to purchase products from the country and in the intention to recommend living and studying there. Turkey recorded the best results in intention to visit or recommend visiting, although the differences with Morocco are minimal.

**Figure 22: Comparison of supportive attitudes for Morocco and the average of the 60 countries with the highest GDP across the G7 and Russia**

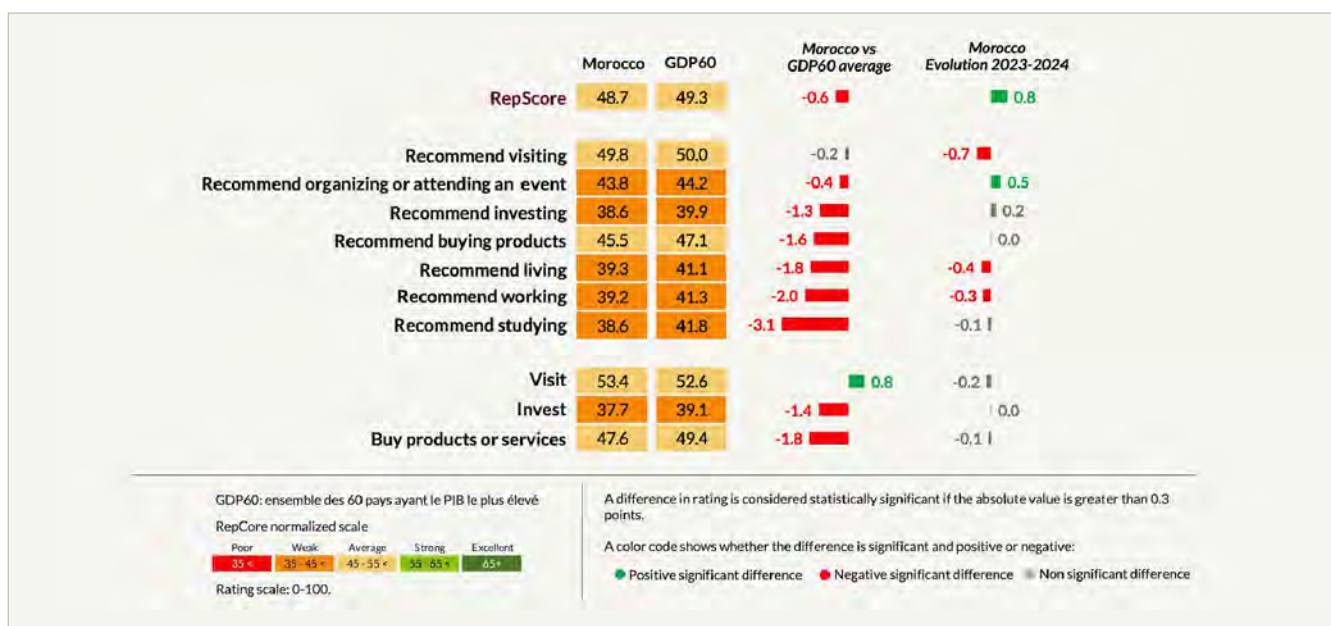

Figure 23: Comparison of supportive attitudes for Morocco and the benchmark countries across the G7 countries and Russia

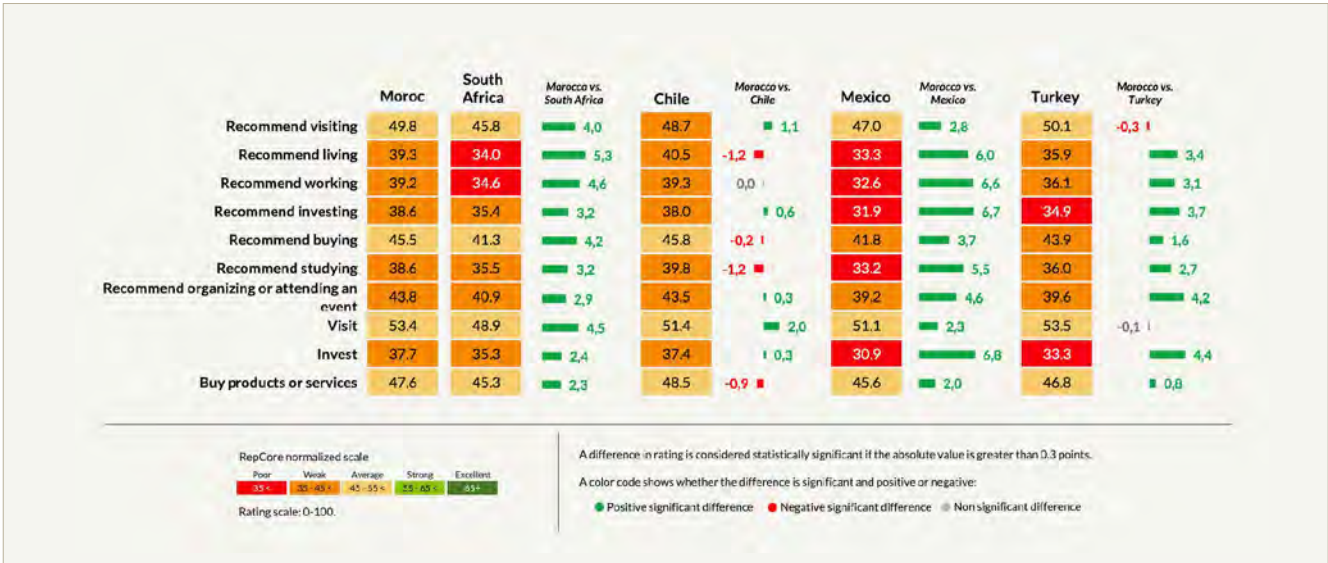

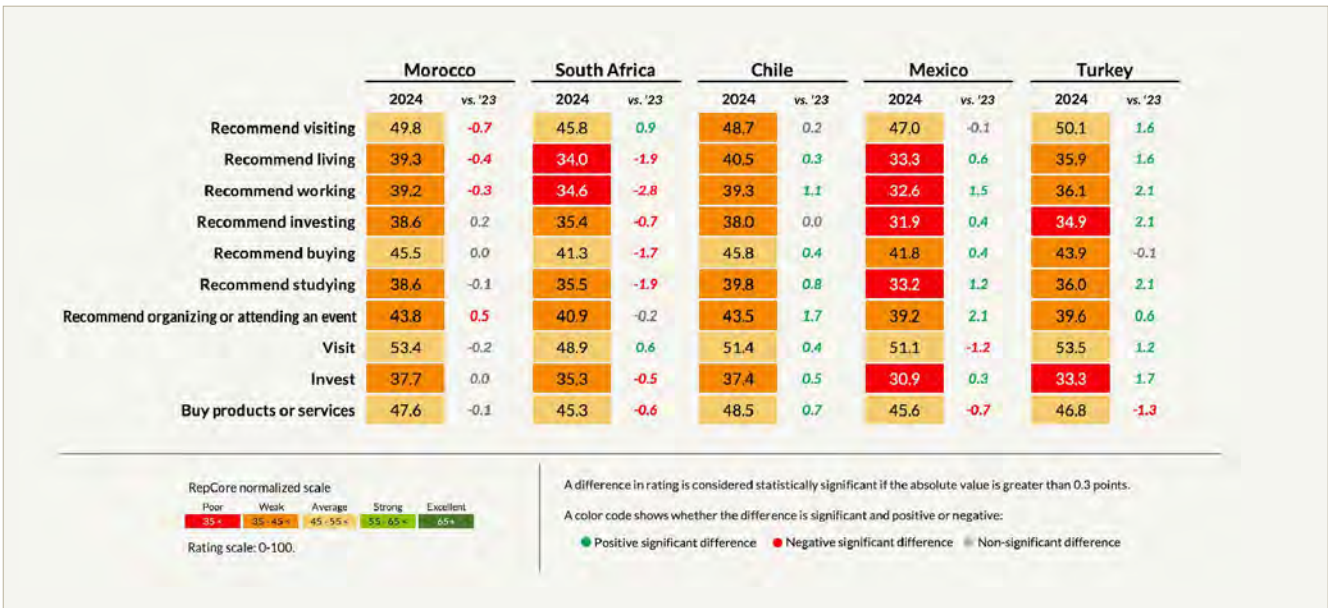

Figure 24: Evolution between 2023 and 2024 in supportive attitudes towards Morocco and the benchmark countries in the G7 countries and Russia

# 3 The reputation of Morocco outside the G7 countries and Russia

## 3.1 The reputation of Morocco in 18 specific countries

Morocco's reputation in the international arena is not homogeneous. It varies considerably depending on the geographical context in which it is analyzed. Morocco achieves its highest score on the reputation indicator (64.8 points) among its own population, which rates its reputation as "strong" (very close to "excellent"). We will return to Morocco's internal reputation in Part 4.

Morocco also enjoys a "strong" reputation (over 55 points) in three other countries: Egypt, Australia and China. It has a moderate reputation in 12 countries, including Germany, France, Mexico, and the United Kingdom, with scores above 50 points. Conversely, it is perceived as weak in 10 countries, with scores ranging from 35 to 45 points. Notably, the Kingdom records its largest decline in Israel, reaching a poor reputation indicator of 33.0 points in 2024.

As previously stated in the introduction to this report, the ongoing conflict in Gaza has had a detrimental impact on Israel's reputation and the perception among the Israeli population of countries advocating for international legality. Morocco is a case in point.

An analysis of Morocco's reputation between 2023 and 2024 indicates notable improvements in 11 of the 27 countries studied. South Africa, Sweden, Nigeria, and Kenya are the countries where Morocco's reputation saw the most significant growth. The overall enhancement in Morocco's reputation in the African countries included in the study can be attributed to the favorable response to the Atlantic Initiative promoted by His Majesty King Mohammed VI.

It is also noteworthy that Morocco's reputation has strengthened in a large market like China, rising from "moderate" in 2023 to "strong" in 2024. However, it is worth noting the unexpected decline in Morocco's reputation in Turkey.

Figure 25: Evolution of Morocco's reputation in specific countries as well as in G7 countries and Russia

### 3.2 Strengths and weaknesses of Morocco's reputation in specific countries

A review of the rational motivations behind Morocco's reputation in the various specific countries reveals that the strengths and weaknesses observed by the public in all G7 countries and Russia are consistent.

Morocco has achieved its highest score in the "Quality of Life" dimension. This result is consistent across the 18 specific markets where the country's reputation was analyzed. Additionally, in nearly all markets, the second-highest rated dimension is "Human Factor," with the exception of China, Kenya, and Nigeria, where other dimensions are perceived more favorably. Therefore, we can conclude that these two dimensions are the primary assets of Morocco's external perception in the specific countries.

Conversely, the "Level of development" and "Ethics and responsibility" dimensions present the most significant areas for improvement in Morocco. In fact, these dimensions are the ones in which Morocco has the lowest ratings in the largest number of specific markets.

Figure 26: Evaluation of Morocco in the 5 rational dimensions in specific Western European countries and Australia

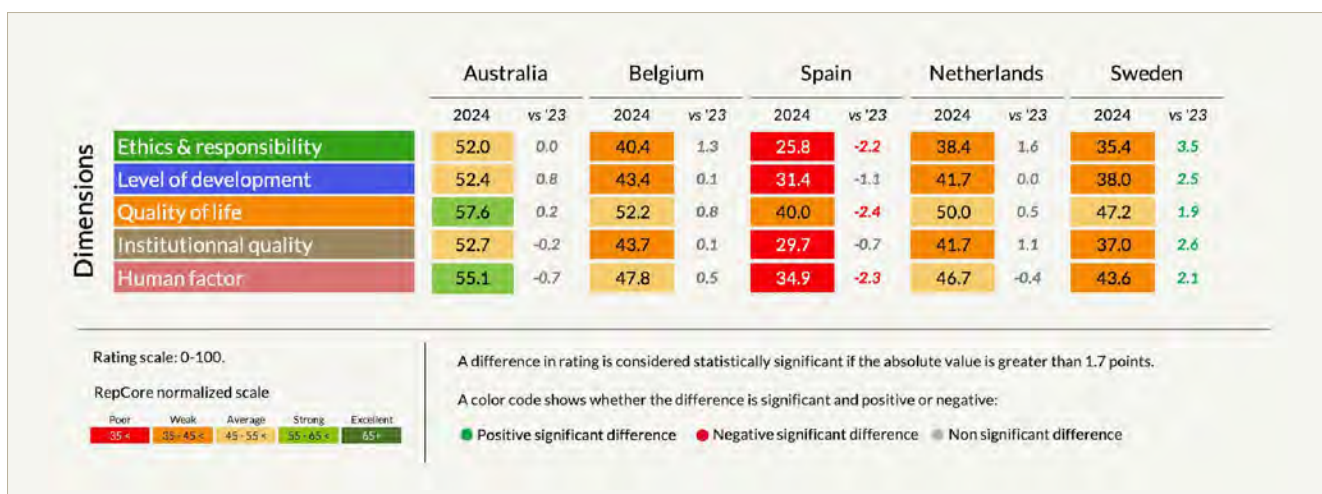

Figure 27: Evaluation of Morocco in the 5 rational dimensions in specific Mediterranean countries

Figure 28: Evaluation of Morocco in the 5 rational dimensions in specific Latin American countries

Figure 29: Evaluation of Morocco in the 5 rational dimensions in specific African countries

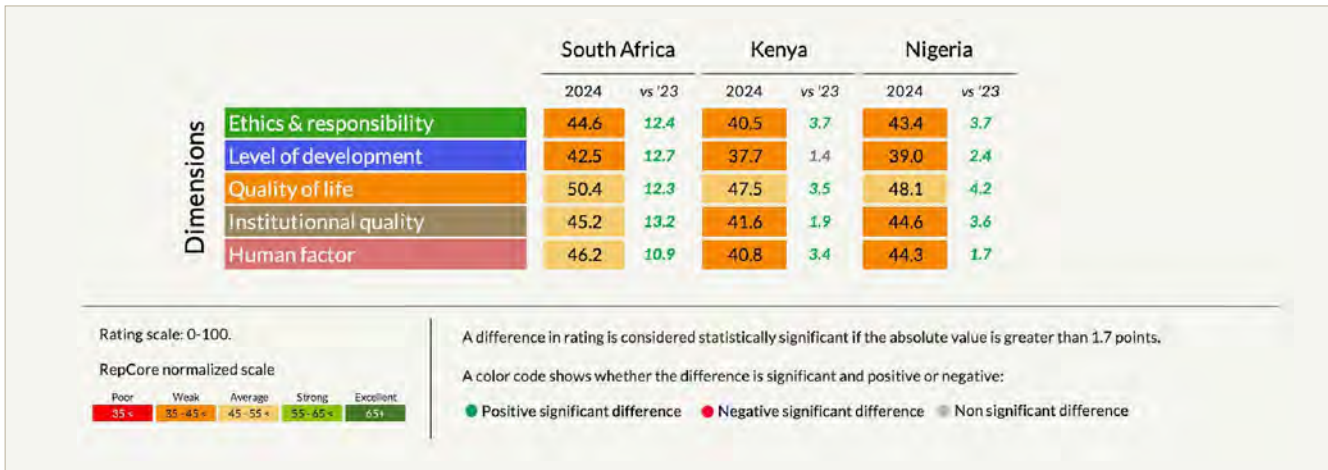

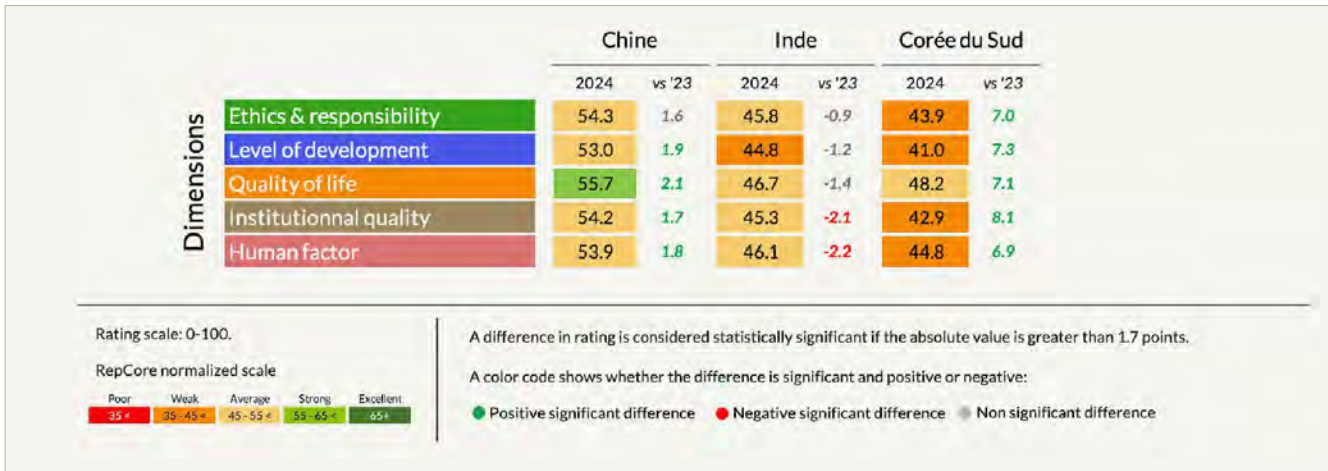

Figure 30: Evaluation of Morocco in the 5 rational dimensions in specific Asian countries

As we move forward with our analysis of the rational component of reputation at the attribute level, we find that Morocco is viewed favorably by the various specific countries. The three attributes that receive the highest scores in nearly all countries are "Leisure and cultural activities," "Appealing natural environment" and "Friendly people," indicating that they are key factors driving overall perceptions.

Similarly, the deficiencies in Morocco's international profile are prevalent across different markets. The attributes "Technologically advanced" and "Well-known brands and companies" receive the lowest ratings in most countries, while the perception of "Ethical and transparent" is also low in European countries surveyed.

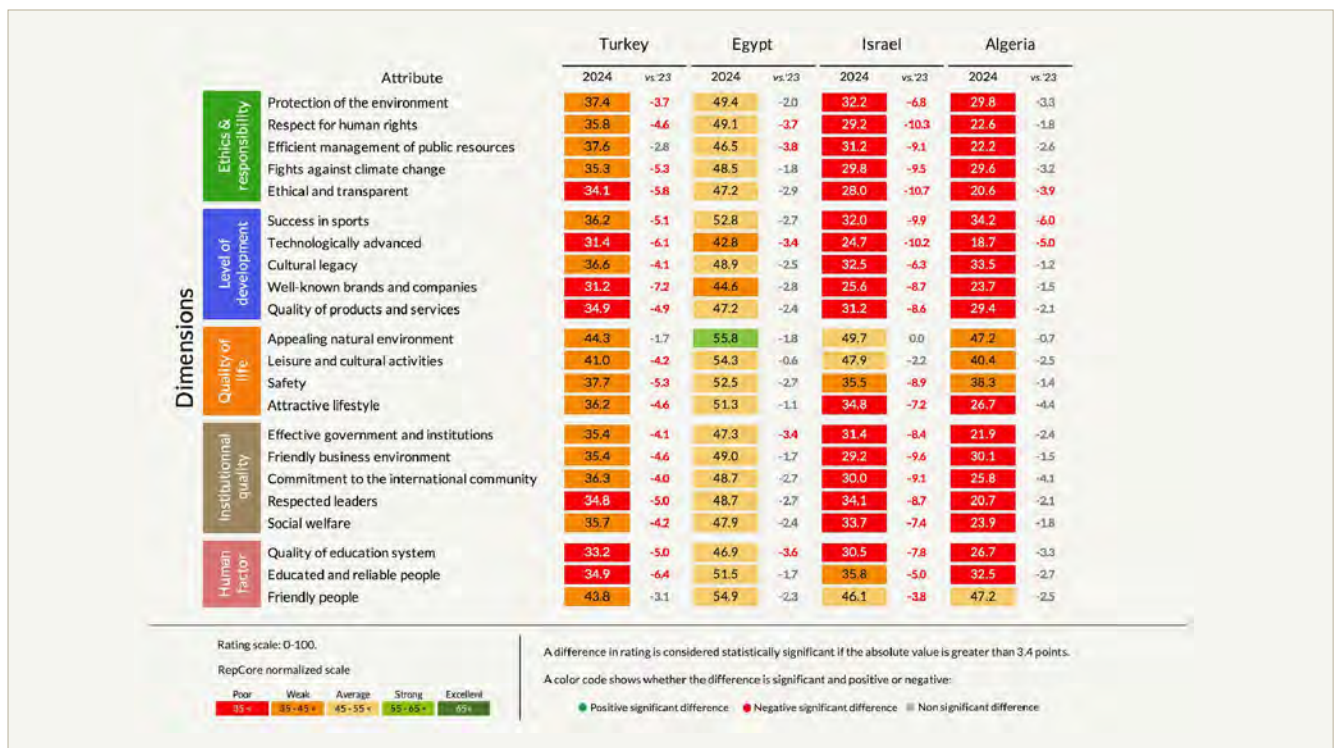

Figure 33: Evaluation of Morocco in the 22 rational attributes in specific Latin American countries

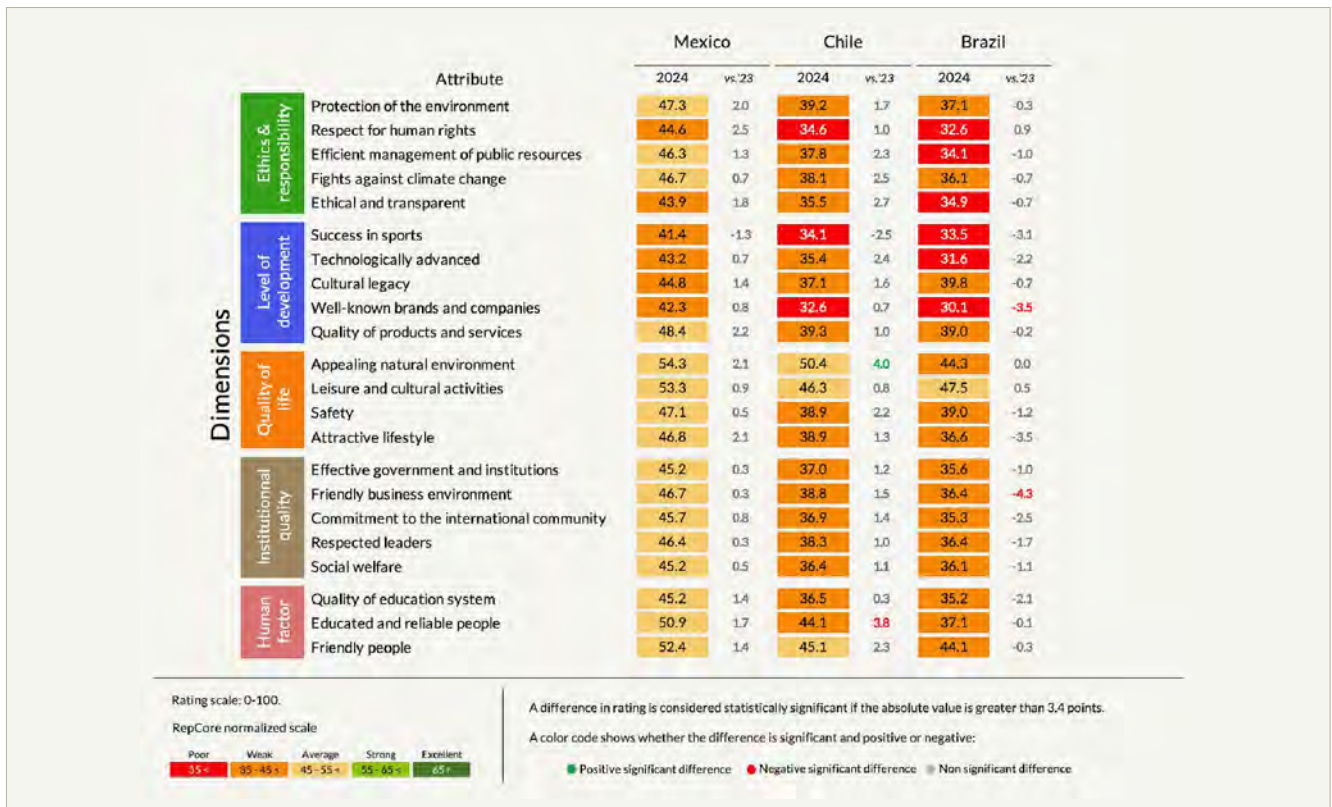

Figure 34: Evaluation of Morocco in the 22 rational attributes in specific African countries

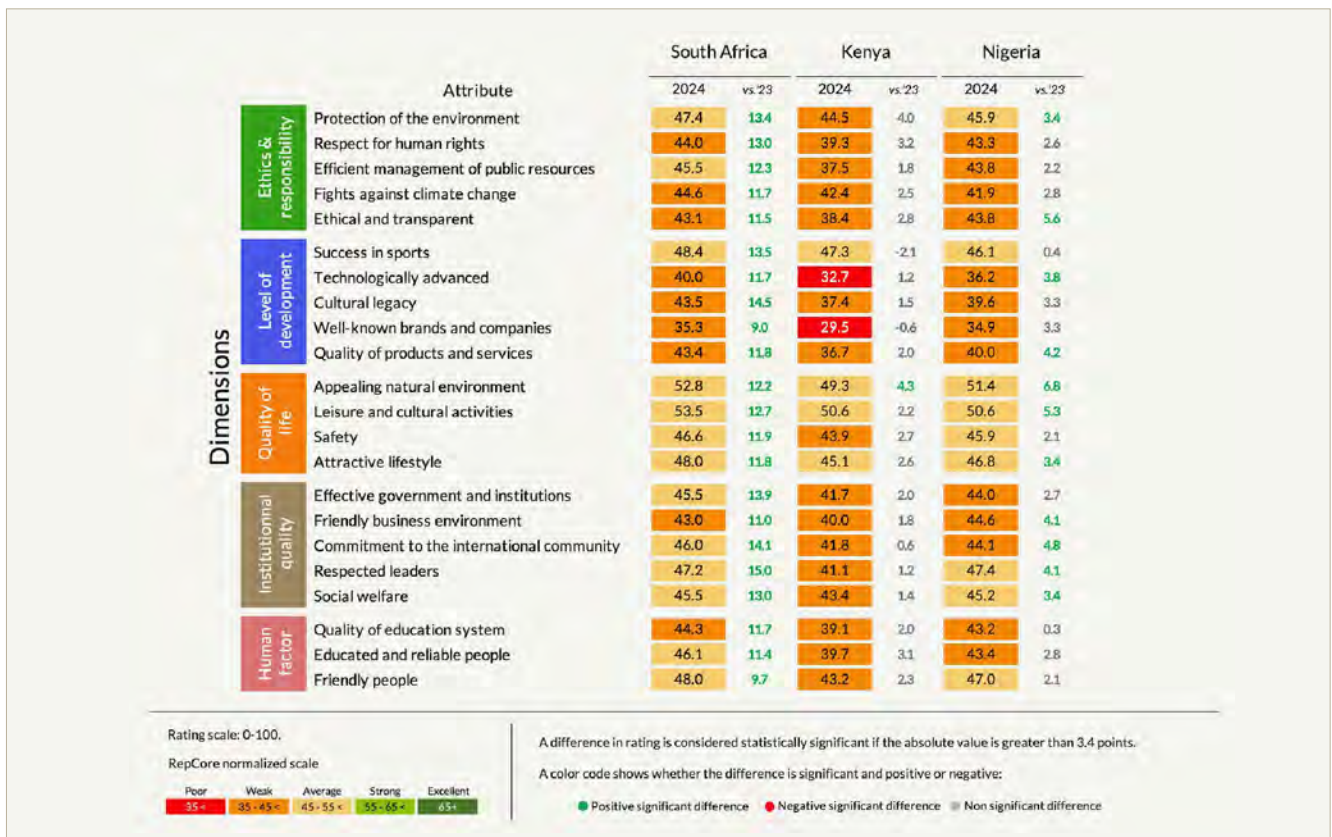

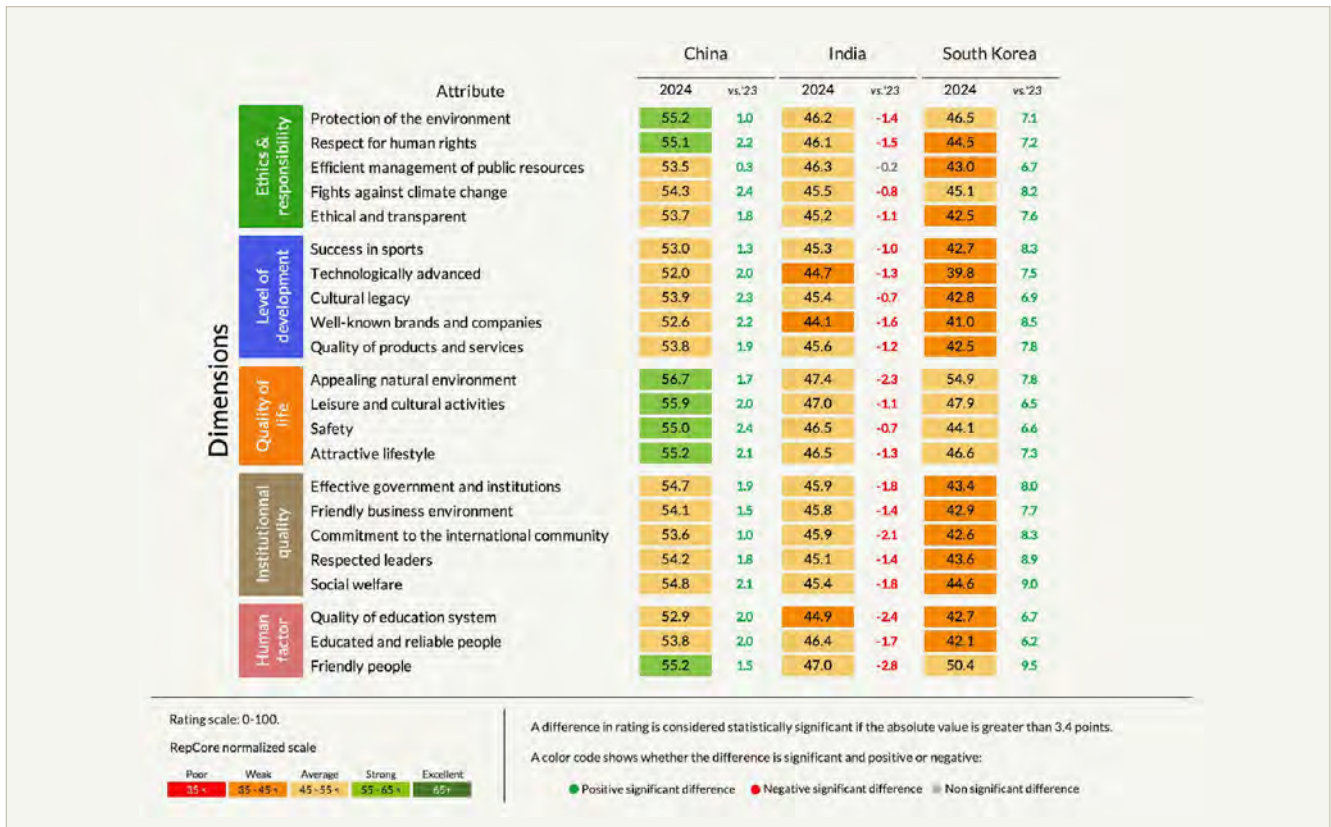

Figure 35: Evaluation of Morocco in the 22 rational attributes in specific Asian countries

### 3.3 Supportive attitudes towards Morocco from inhabitants of specific countries

The value of managing a country's reputation lies in its tangible impact on value creation. A country that is admired will naturally attract more visitors, who will then appreciate its products or services, or even invest in it. This phenomenon, which also works for companies, has been known since 2010 as "the reputation economy".

The data from the RepCore® Nations 2024 study once again validates the premise that reputation drives value. There is a significant correlation between the reputation indicator RepScore, and the supportive attitudes expressed by stakeholders in the various countries analyzed. Morocco is a case in point. In countries where the RepScore is highest, the support attitudes of the respondents are also highest.

Morocco performs well in terms of supportive attitudes in most markets, particularly in relation to willingness to visit, recommend visiting and purchase Moroccan products or services. In contrast, there is less favorable sentiment regarding Morocco in relation to willingness to invest or recommend studying there. Additionally, there is room for improvement in terms of recommending living or investing in Morocco.

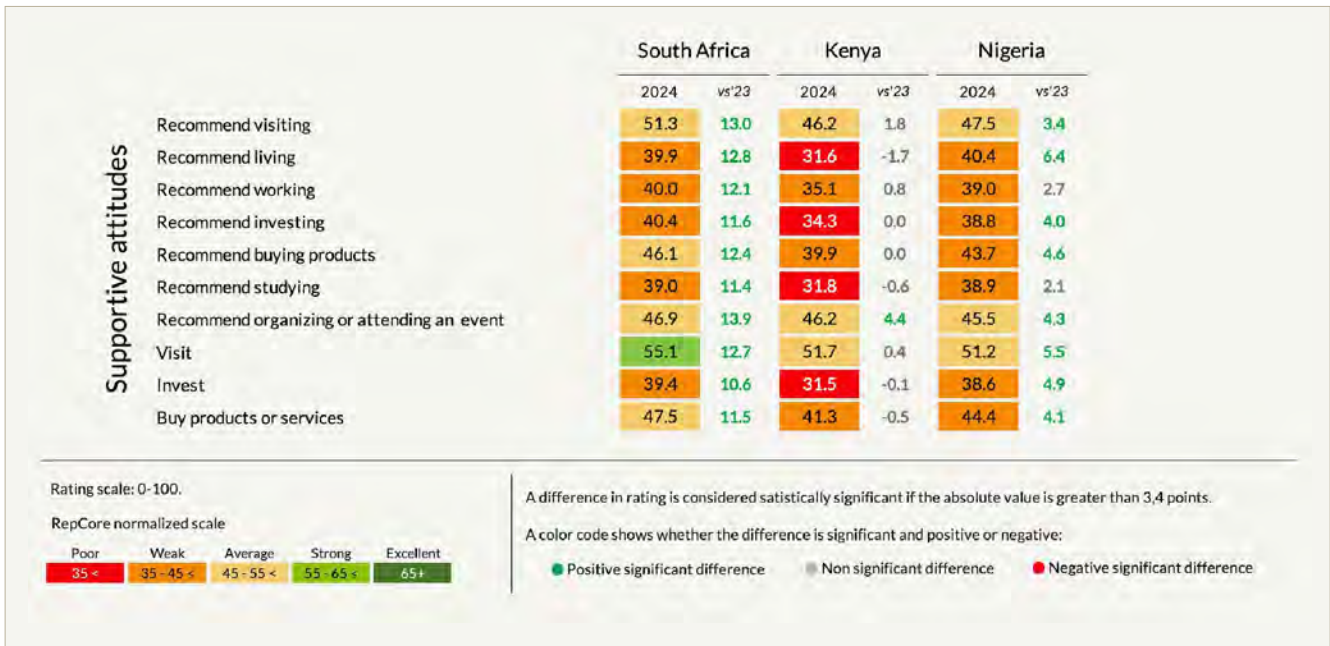

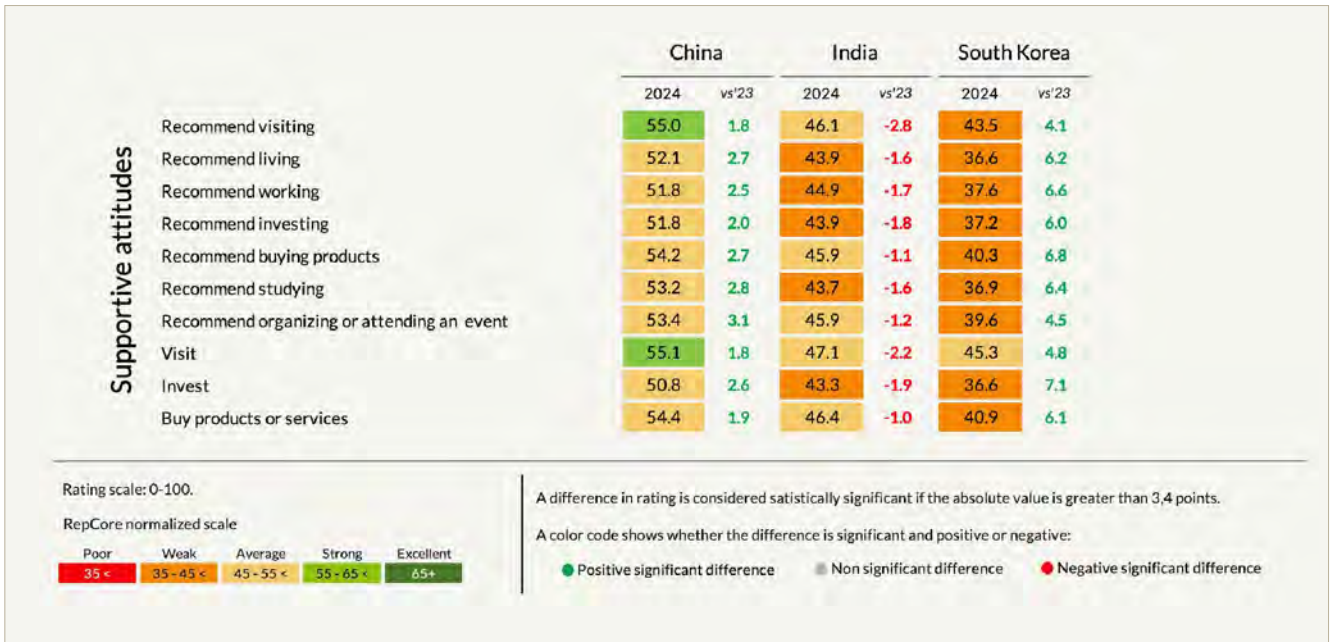

Figure 40: Supportive attitudes towards Morocco in specific Asian countries

# 4 The internal reputation of Morocco

## 4.1 The internal reputation of Morocco in relation to its external reputation

Morocco saw a notable improvement in its internal reputation in 2024 compared to the previous year, with the reputation indicator reaching its highest point in the historical series since 2015, at 64.8 points. This level of reputation level is regarded as "strong," just two-tenths of a point shy of "excellent."

This represents an extremely positive outcome, independent of any global trends, and a reflection of reflecting the country's commendable progress. In 2024, the average evolution of the 16 countries where the internal reputation was analyzed saw minimal movement, at just +0.3 points, despite notable shifts upwards (France and South Africa) and downwards (Japan and the UK) that offset one another.

Figure 41: Evaluation and evolution, between 2023 and 2024, of the internal reputations of various countries

Figure 42: Evolution of Morocco's internal and external reputation

As a result of this notable enhancement in Morocco's internal reputation, the gap between its internal and external reputations increased to 16.1 points, representing the widest difference observed in the historical data series. Normally, the inhabitants of a country tend to evaluate their own country more favorably than international observers. There are, however, rare exceptions, such as Japan or Italy, where external perception is much better than internal perception, or other countries such as Russia and China, where the

perception of their reputation is markedly different, with excellent assessments by their fellow citizens contrasting with a poor international reputation.

Moroccans have a positive view of the Kingdom, which makes them effective ambassadors for their country's brand. However, they do not display the same extreme levels of positivity seen in the previous examples.

Figure 43: Comparison between the internal and external reputations of different countries in the G7 and Russia

## 4.2 Strengths and weaknesses of Morocco as perceived by Moroccans

The evaluation of Morocco by its own citizens in the rational attributes reveals a notable discrepancy between its strengths and weaknesses. While the country exhibits considerable strengths across various rational attributes, there are also significant shortcomings.

In absolute terms, Morocco scores over 55 points for eight attributes, which is equivalent to a "strong" score on the RepCore® normative scale, two of which even exceed 65 points, equivalent to an "excellent" level on the aforementioned scale, namely "Friendly people" and "Appealing natural environment". The table below illustrates these strengths as perceived by the inhabitants of Morocco.

**Tableau 1 :** Points forts de la perception interne du Maroc

Attribute	Score
<i>Friendly people</i>	66.8 points
<i>Appealing natural environment</i>	66.4 points
<i>Leisure and cultural activities</i>	62.6 points
<i>Safety</i>	61.7 points
<i>Commitment to the international community</i>	57.7 points
<i>Success in sports</i>	57.4 points
<i>Cultural legacy</i>	57.3 points
<i>Fights against climate change</i>	55.3 points

In seven attributes, Morocco performs poorly in terms of internal perception, with scores below 45 points on the normative scale.

These weaknesses in the internal perception are concentrated in the following attributes:

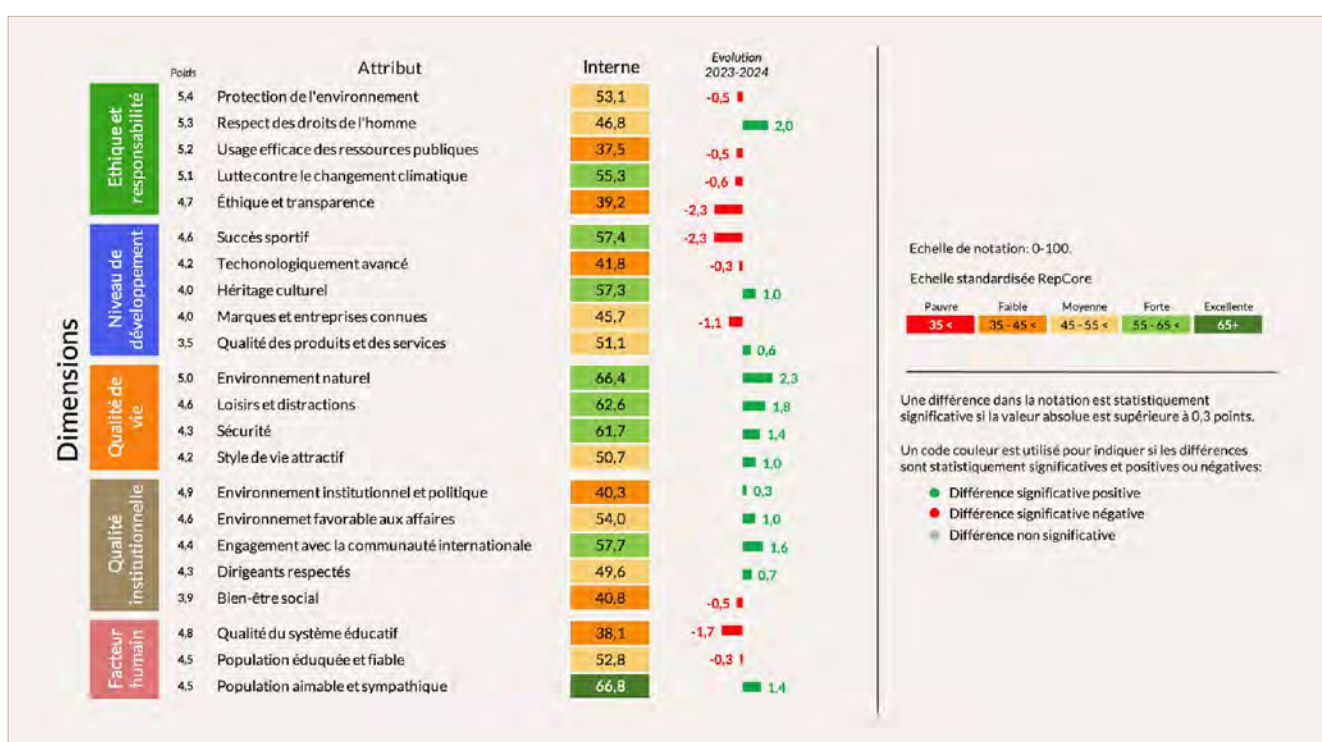

**Table 2:** Weaknesses of Morocco's internal perception

Attribute	Score
<i>Efficient management of public resources</i>	37.5 points
<i>Quality of the education system</i>	38.1 points
<i>Ethical and transparent</i>	39.2 points
<i>Effective government and institutions</i>	40.3 points
<i>Social welfare</i>	40.8 points
<i>Technologically advanced</i>	41.8 points

In 2024, the strengthening of internal perception concerns attributes such as "Appealing natural environment" (+2.3 points), "Respect for human rights" (+2.0 points), "Leisure and cultural activities" (+1.8 points) and "Commitment to the international community" (+1.6 points).

However, some attributes experienced a notable decline. For instance, the attribute "Success in sports" (-2.3 points) was adjusted downward following the considerable increase in 2023, which corresponded to the soccer team's success at the Qatar World Cup. A similar adjustment was made for "Ethical and transparent" (-2.3 points) and "Quality of education system" (-1.7 points).

Figure 44 : Evaluation interne du Maroc dans les attributs rationnels et son évolution entre 2023 et 2024

As has been the case in previous years, there are significant differences between the internal and external perceptions of Morocco. While internal evaluations of rational attributes are typically more favorable than external assessments, one group of attributes deviates from this trend.

There are five attributes where the perceptions of Moroccans of their homeland are significantly lower than those of international observers:

- ▶ "Efficient management of public resources" (-7.7 points)
- ▶ "Quality of the education system" (-5.5 points)
- ▶ "Effective government and institutions" (-4.4 points)
- ▶ "Social welfare" (-4.0 points)
- ▶ "Ethical and transparent" (-3.2 points)

These attributes could represent risks for Morocco's reputation, particularly given that internal perceptions are often shaped by more extensive experience than external perceptions, which are frequently influenced by communication and stereotypes. However, the citizens of each country tend to be more critical of their own nation when it comes to ethics/corruption and institutional quality. Negative information on these issues often has a significant impact within the country. The evaluation of Moroccan citizens of the quality of the education system and social welfare is nevertheless cause for concern, suggesting the need to accelerate the implementation of reforms in these areas.

Attributes in which Moroccans, better informed than international observers, rate their country much more positively, could represent long-term communication opportunities. For example, "Safety," "Fights against climate change," and "Cultural legacy" could be used to differentiate the country brand. International communication supported by validated information illustrating Morocco's strength in these areas could improve public perception in the tourism and investment-sending countries.

### 4.3 Comparison of the reputation of the Kingdom and the benchmark countries in Morocco

Moroccan ratings of Morocco are significantly higher than those of reference countries in terms of admiration, respect, and trust. Turkey has the best reputation indicator among the benchmark countries (54.0 points), but is nevertheless more than 10 points below Morocco, at a "moderate" level. Mexico (40.9 points), Chile (39.4 points) and South Africa (35.6 points) are rated unfavorably by the Moroccan population, with low reputation indicators.

From 2023 to 2024, Turkey's reputation indicator in Morocco remained stable (+0.2 points), South Africa's indicator showed a statistically non-significant improvement (2.6 points), while Mexico's (-2.6 points) and Chile's (-3.9 points) reputations declined.

Figure 45: Evolution of the reputation of Morocco and the benchmark countries in Morocco between 2023 and 2024

An analysis of internal perceptions in the benchmark countries, i.e. how each country is rated by its own citizens, shows that all countries achieve a "strong" reputation indicator RepScore, with the exception of South Africa, which receives a "moderate" rating from its citizens.

Of the five countries included under consideration, South Africa experienced the most favorable evolution in its internal reputation between 2023 and 2024 (+5.0 points), followed by Morocco (+3.7 points) and Turkey (+3.3 points). Over the same period, Mexico and Chile experienced a slight decline in their reputation indicators (statistically non-significant), with a score decrease of -1.3 points and -1.4 points, respectively.

Figure 46: Evolution between 2023 and 2024 of the internal reputation of Morocco and benchmark countries

Moroccans perceive their country better than South Africa, Chile and Mexico in all the rational attributes of the RepCore® Nations model, with big differences in some of them. However, the comparison with Turkey deserves particular attention.

Moroccans give their country significant advantages over Turkey in attributes such as "Friendly people" (+27.1 points), "Success in sports" (+16.8 points) and "Safety" (+12.4 points). In contrast,

respondents expressed significantly more favorable perceptions of Turkey than of their own country on seven key attributes:

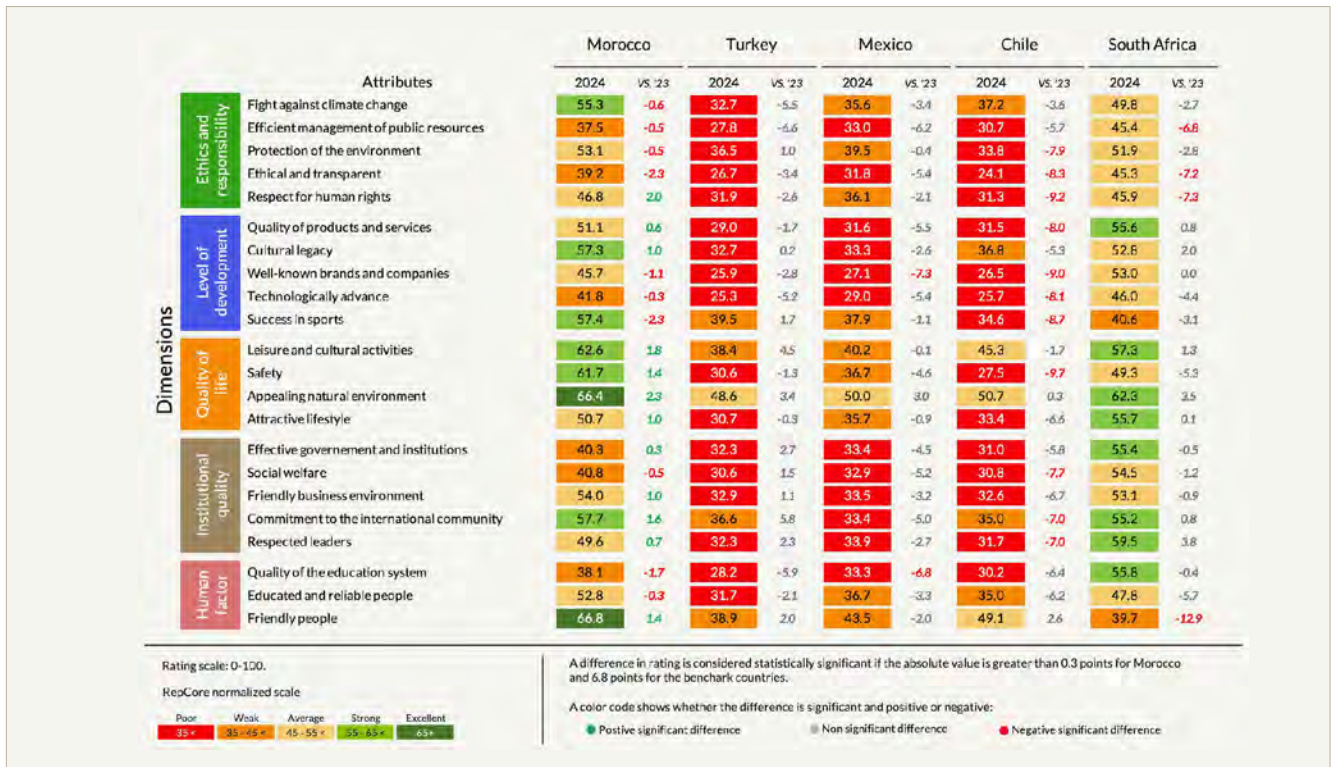

- ▶ "Quality of the education system" (+17.7 points)
- ▶ "Effective government and institutions" (+15.1 points)
- ▶ "Social welfare" (+13.7 points)
- ▶ "Respected leaders" (+9.9 points)
- ▶ "Efficient management of public resources" (+7.9 points)
- ▶ "Well-known brands and companies" (+7.4 points)

These differences highlight some of the deficiencies in Morocco's internal reputation that were previously mentioned.

**Figure 47:** Evaluation in Morocco of the perception of Morocco and of the benchmark countries in terms of rational attributes

Figure 48: Evolution between 2023 and 2024 in the rational attribute for Morocco and benchmark countries in Morocco

This analysis demonstrates once again that the "Security" and "Fights against climate change" attributes present valuable communication opportunities for Morocco, as they are positively

evaluated domestically and confer distinct advantages to the Kingdom over benchmark countries.

#### 4.4 Moroccans' supportive attitudes towards Morocco and the benchmark countries

In accordance with the improvement of the internal reputation of the Kingdom in 2024, the supportive attitudes of Moroccans towards their country exhibit a positive evolution, albeit at a more moderate pace than that of the reputation indicator.

attend or organize events in the country (+2.3 points) and the intention to invest in the country (+1.7 points). The exception to these positive movements is the recommendation to study in the country, which fell slightly (-0.6 points), weighed down by the decline in the internal assessment of the attribute "Quality of the education system".

The supportive attitudes showing the most positive trends are the recommendation to visit the country (+2.5 points), the recommendation to

In any case, Moroccan nationals continue to be good ambassadors for their country's brand, rating almost all supportive attitudes as "strong" and the

intention to visit the country as "excellent". Only the recommendation to study or work in the country registers moderate values.

Figure 49: Evolution of supportive attitudes towards Morocco between 2023 and 2024 in Morocco

A comparison of Moroccan attitudes towards their country with those towards reference countries reveals that support for Morocco is generally

higher, particularly in terms of investment intentions, visit intentions and recommendations to live in the country.

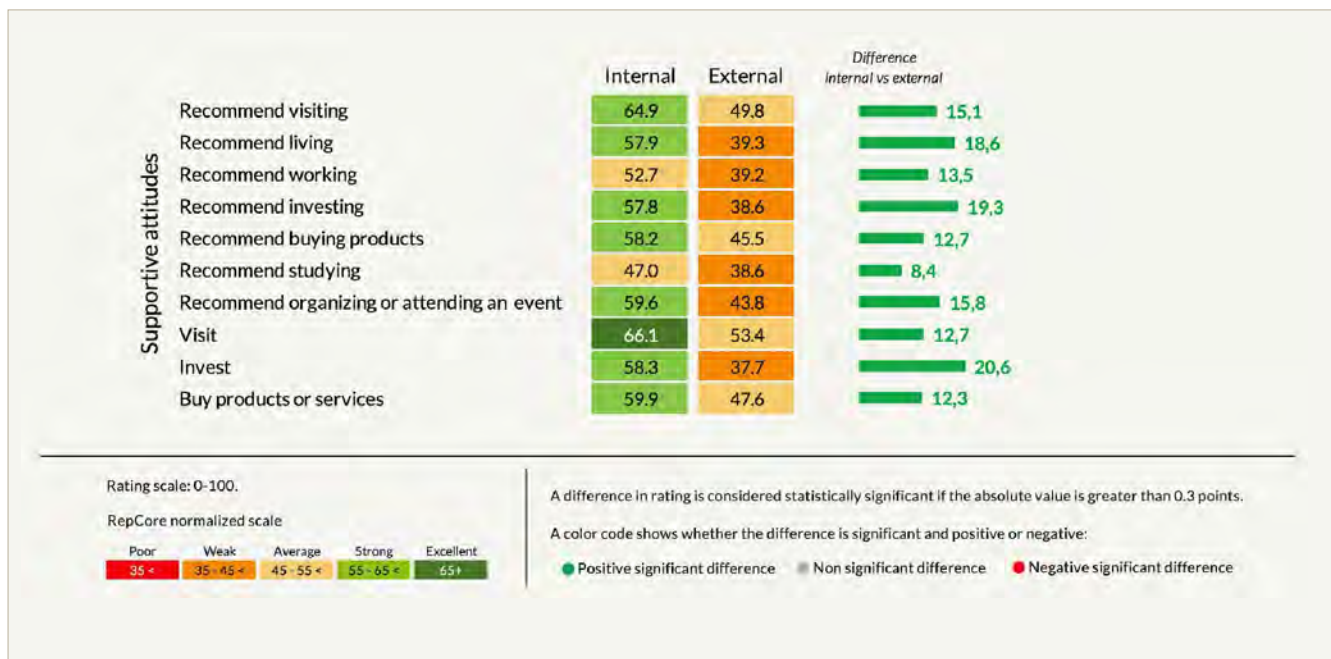

Figure 50: Supportive attitudes towards Morocco vs the benchmark countries in Morocco

It can be stated that, in general, Moroccans exhibit positive attitudes towards their country, which aligns with the high internal reputation indicator. In all the supportive attitudes analyzed, Morocco is

evaluated more favorably by its own inhabitants than by international observers. This is particularly evident in areas such as the intention to invest, where the discrepancies are notably significant.

**Figure 51:** Comparison of the internal and external evaluations (G7 countries and Russia as a whole) for Morocco in terms of the supportive attitudes.

# 5 The international community's perception of the Royal Initiative for Atlantic Africa

The 2024 edition of the study on Morocco's reputation in the world included questions on the Royal Initiative for Atlantic Africa to evaluate the level of awareness and perception of this Initiative by the international community and its impact on the Kingdom's external reputation.

Awareness of the Royal Initiative for Atlantic Africa reaches 81% in Turkey, between 50% and 65% in Nigeria, China and India, and 45% in Kenya and Egypt, reflecting the interest of these countries in the opportunities offered by the African continent.

On the other hand, the initiative is less well known in the Netherlands, Canada, Belgium and Sweden, with less than 20% of respondents aware of it.

In the specific case of G7 countries + Russia, awareness of the Initiative is highest in the USA (32%) and Germany (31%), followed by France (28%), Japan (28%), Russia (27%), Italy (25%) and the UK (21%). This level of knowledge barely exceeds 18% in Canada.

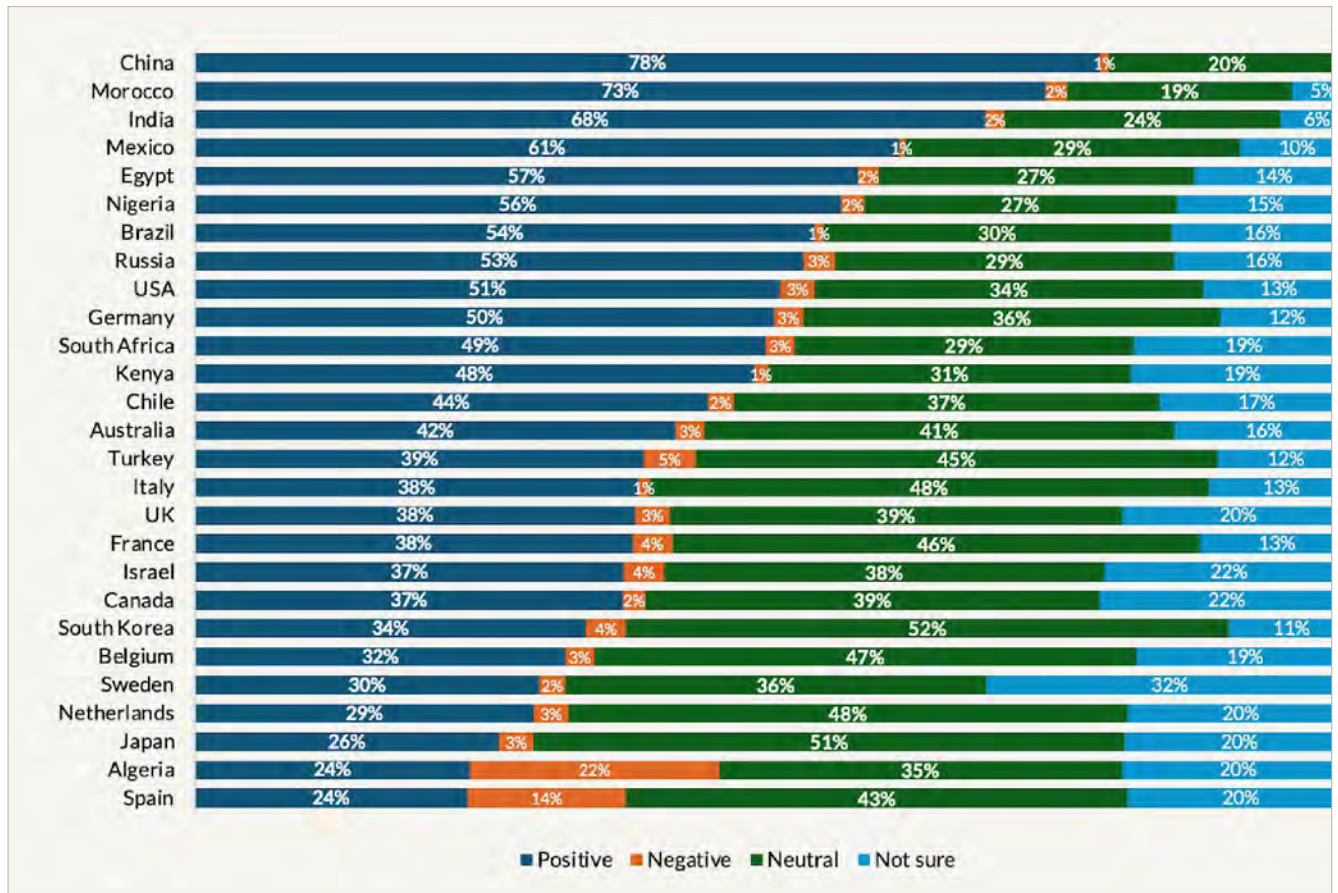

Figure 52: Awareness of the Royal Initiative for Atlantic Africa

The Royal Initiative for Atlantic Africa is perceived positively in the majority of the 26 countries included in the study, with particularly excellent ratings in Australia, Germany, the United States,

the United Kingdom, and the Netherlands. In contrast, the perception of the Initiative in Algeria and Spain is particularly unfavorable.

Figure 53: Perception of the Royal Initiative for Atlantic Africa

In terms of the tangible impact of the Royal Initiative for Atlantic Africa on the external reputation of Morocco, the results are promising. One of the reasons is the considerable positive divergence observed in Morocco's external reputation indicator between respondents “aware”

of the Initiative and those “unaware”. By way of illustration, the difference in question stands at 18.2 points in Australia, 17.9 points in Sweden, 17.4 points in South Africa, 13.3 points in Nigeria, 10.6 points in Kenya, and 7.6 points in Algeria.

Figure 54: Impact of the Royal Initiative for Atlantic Africa on the external reputation of Morocco

## 6 Conclusions

### International context once again had a strong influence on a country's reputation results

In 2024, the international and geopolitical context continued to influence the reputation of various countries, as they had to react and position themselves regarding major international events, sometimes to the detriment of public opinion. The year 2024 was marked by the following key events:

- ▶ The war in Ukraine: after two years of armed confrontation, the conflict continues without significant progress and has started to lose its international profile. However, its geopolitical implications and possible outcomes remain a key element in international politics.
- ▶ The conflict in Gaza: this ongoing crisis has had a major impact on the international perception of Israel, as well as on the perception of other countries among the Israeli population.
- ▶ The upcoming elections in the United States: the polarization of American society and its influence on the position of its government in relation to the two aforementioned conflicts are a source of uncertainty on the international scene.

### Stability in Country Reputation Metrics Across Various Countries

The analysis of the behavior of the reputation indicators of the 60 countries with the highest gross domestic product reveals relative stability. The average reputation index of the main economies rated by the general public in the G7 countries and Russia, which had fallen slightly in 2023, saw a 0.5-point increase in 2024.

The countries whose reputations improved in 2024 were Ethiopia, Thailand, Peru, and Qatar. Conversely, the countries whose reputations have deteriorated are Israel and Ukraine: the former has suffered due to its disproportionate military intervention in Gaza, which has been perceived

very negatively on the international scene; the latter, which previously enjoyed the empathy of outside observers following the Russian invasion, appears to have lost some of that support after two years of war.

Switzerland, Norway, Sweden and New Zealand top the ranking, although none of them achieves the "excellent" reputation level, while Russia, Iraq and Iran are the countries with the poorest reputation indicators (RepScore) for the third year running, all three ranking "poor" on the RepCore® normative scale.

## Morocco climbs 4 places in international reputation ranking across among G7 countries and Russia as a whole

Morocco has made a notable improvement in its external reputation, with a 0.8-point increase bringing the score to 48.7; placing it in the moderate range of the RepCore® normative scale, slightly below the average of the 60 countries with the highest GDP (49.3). Currently ranked 30th, Morocco has risen four positions from 2023 and now holds the best reputation among African and Arab countries.

The enhancement in Morocco's standing is more pronounced in the countries where it has been

analyzed, with an average increase of one point. Notably, Morocco has seen a substantial rise in its internal reputation, with a 3.7-point growth reaching its historical peak of 64.8 points and nearing the "excellent" level.

Morocco's benchmarks also show a slightly positive trend in 2024: Chile (+0.8 points), Mexico (+0.7 points), South Africa (+0.4 points) and Turkey (+0.1 points).

## "Ethics and responsibility" remains the most influential dimension in building nations' reputation

Public opinion expectations in the G7 countries and Russia remain stable, with no significant shifts in the weighting of variables compared to 2023. The "Ethics and responsibility" dimension proves to be the most crucial factor in shaping a nation's reputation, representing 25.7% of the total weight.

The top four attributes are "Protection of the environment," "Respect for human rights," "Efficient management of public resources," and "Fights against climate change."

## Slight improvement in Morocco's rational reputation profile

On a rational level, perceptions of Morocco show slight improvement in most of the attributes analyzed, notably in "Protection of the environment," "Respected leaders," and "Quality of products and services." However, compared to 2023, attributes such as "Safety," "Well-known brands and companies," and "Success in sports" have seen a decline in scores.

The analysis should focus on key attributes that, while currently below the average of the 60 countries with the highest GDP, have the potential to become future strengths such as "Protection of the environment", "Fights against climate change", and "Efficient management of public resources".

To further enhance Morocco's international reputation through specific actions, it is crucial to consider the gaps between perception and reality.

## Morocco's reputation profile varies across geographic locations

A broader analysis of Morocco's reputation on the international stage reveals an improved reputation profile in China, South Korea, and African countries (notably South Africa, Nigeria, and Kenya).

However, a significant decline in Morocco's reputation has been observed across a range of variables in Mediterranean countries, particularly in Israel, Turkey, Algeria, Egypt, and Spain.

## The internal reputation of Morocco shows significant progress

In line with the internal reputation indicator, Moroccans' assessments of their own country have improved, particularly in the variables such as "Appealing natural environment", "Respect of human rights", "Leisure and cultural activities", and "Commitment to the international community".

However, there are some significant exceptions in certain attributes where the country's internal perception has declined, particularly in "Ethical and transparent", "Success in sports" and "Quality of education system".

## The discrepancy between internal and external perceptions suggests both communication opportunities and reputational risks

A comparison of internal and external (G7 and Russia) perceptions of Morocco reveals notable discrepancies. Moroccan respondents hold more favorable views of the Kingdom than nationals of the G7 countries and Russia in terms of the attributes "Safety", "Friendly people", "Success in sports", "Commitment to the international community," and "Cultural legacy.", which represent potential communication opportunities. In contrast, Moroccan respondents are less

enthusiastic about Morocco than foreign observers in variables such as "Efficient management of public resources", "Quality of the education system", "Effective government and institutions", "Social welfare", and "Ethical and transparent". These shortcomings could pose real risks to Morocco's reputation, both internally and externally, and should be addressed as a matter of priority.

## **There is a strong correlation between the country's reputation and the supportive attitudes of foreign observers**

As in previous editions of the study, there is a strong correlation between the reputation indicator and supportive attitudes.

Morocco performs well in terms of the intention to visit the country among the inhabitants of the G7 countries and Russia, with an indicator score exceeding the average of the 60 countries with the highest GDP. Conversely, Morocco receives the lowest score when it comes to the recommendation to study there.

Moroccans are good ambassadors for their country and their supportive attitudes towards Morocco are generally positive, significantly higher than external evaluations. All these attitudes also had a positive evolution between 2023 and 2024, except for the recommendation to study in the country.

## **The Royal Initiative for Atlantic Africa has been very well received**

The Royal Initiative for Atlantic Africa, promoted by His Majesty King Mohammed VI, has been well acclaimed on the international scene, with a very

positive impact on the Kingdom's external reputation. Its impact has been considerable, especially in Turkey, India, China, and Nigeria.

# Appendix 1

## Rankings of the 72 countries examined by Reputation Lab according to the variables in the RepCore® Nations model

In this appendix, you will find the rankings of the 72 countries included in the RepCore® Nations 2024 study, according to the scores obtained for each of the variables monitored by the RepCore® Nations model:

- ▶ RepScore indicator
- ▶ Rational attributes (22)
- ▶ Supportive attitudes (7)

Each table presents the country's ranking in the 2024 study, along with a comparison to its position in 2023.

The RepCore® normative scale was used to qualify the score obtained.
